Deaths by Lightning 192

INDEX of DISTRICTS, SUB-DISTRICTS, and of certain TOWNS, referring by Numbers to the several TABLES of ABSTRACTS 193-207

REPORT

TO

The Right Honourable Sir GEORGE GREY, Bart., G.C.B., M.P., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office, Somerset House,
1st June 1864.

SIR,

I HAVE now the honour to submit to you my Report on the results of the Registration of the year 1862.

1,477,310 names have been inscribed on the Registers of the year; comprising the names of 328,060 persons married, 712,684 children born, and 436,566 persons who died at all ages, some having seen the light only for a few minutes, and others having lived through an age of a hundred years.

The marriages were less than the average number, and thus reflected the passing suffering of the people from the depression of the cotton manufacture.

All the births in the first years after the Act came into operation in the year 1837 were not registered; but since 1851 the present system has been in full operation, and the birth-rate of the year 1862 exceeded the rate of every year except the rate of the year 1859, which it equalled. To every 100 persons living 3·504 children were born in both years.

The mortality was at the rate of 2·147 per cent.; which is ·078 below the average, and lower than the mortality in nineteen out of the twenty-four years preceding.

TABLE I.—Estimated **Population**, with the Number of **Marriages, Births,** and **Deaths** registered in **England,** in each **Year** from **1838** to **1862.**

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of the Years.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS.	EXCESS OF BIRTHS OVER DEATHS.
1838	15,312,256	118,067	236,134	463,787	342,760	121,027
1839	15,515,296	123,166	246,332	492,574	338,984	153,590

1854	18,616,310	159,727	319,454	634,405	437,905	196,500
1855	18,829,000	152,113	304,226	635,043	425,703	209,340
1856	19,042,412	159,337	318,674	657,453	390,506	266,947
1857	19,256,516	159,097	318,194	663,071	419,815	243,256
1858	19,471,291	156,070	312,140	655,481	449,656	205,825
1859	19,686,701	167,723	335,446	689,881	440,781	249,100
1860	19,902,713	170,156	340,312	684,048	422,721	261,327
1861	20,119,314	163,706	327,412	696,406	435,114	261,292
1862	20,336,467	164,030	328,060	712,684	436,566	276,118

* The Population of each of the years since 1851 is deduced from the ascertained rate of increase observed in the twenty years, 1841-61; and an allowance is made for the decrease in the rate during the latter ten years. On another hypothesis the numbers would differ slightly from the estimate here given, but as the rates of births, deaths, and marriages have been calculated on these numbers it is not considered advisable to give any other estimate of Population.

It is thus gratifying to find, that, notwithstanding the depression of one great branch of trade, which was prudently met by a reduction of marriages, the health of the country remained better than it had been in many previous years.

Marriages.

164,030 marriages were solemnized in the year; 129,733 or 79 per cent. according to the rites of the Established Church, and 34,297 or 21 per cent. *not* according to the rites of the Established Church. 19,486 marriages were by licence, 102,870 after banns, 3966 on Superintendent Registrar's certificate; and in 3393 instances it was not stated under which of those heads the marriages should be placed. In Roman Catholic Chapels there were 7345 marriages; in the registered places of other Christian denominations there were 13,870 marriages; and in the offices of the Superintendent Registrars 12,723. In 1847 the number of marriages in Roman Catholic places of worship was only 2961, while in 1862 they numbered 7345; this increase is partly due to the additional number of Foreigners and Irish resident in England since the former year. At the Census of 1851, 50,289 subjects of Foreign States resided in England, and this number was augmented to 84,090 in 1861. London is the principal seat of foreign residents; it contained 25,670 in 1851, and 40,909 in 1861; considerable numbers also locate themselves in the other large towns. The 519,959 natives of Ireland resident in England in 1851 increased to 601,634 in 1861. The marriages of Quakers numbered 59, and there were 300 nuptial celebrations among the Jews.

The marriages were below the average, for while there are usually 1·639 persons married to every 100 persons living, in 1862 only the marriages of 1·614 persons were solemnized to every 100 persons living. The distress in the cotton manufacturing districts, together with a less productive harvest than usual, operated in causing a large number of persons to postpone the founding of new families until a more hopeful

---

Table II.—**Proportion** of **Marriages, Births,** and **Deaths** to the **Population** of **England,** in each **Year** from **1838** to **1862.**

Years ended Dec. 31st	To 100 Persons living.				The Number of Persons living

Mean . .	·819	1·639	3·325	2·225	122	61	30	45

Note.—The Table may be read thus:—In the year 1838 to every 100,000 persons living there were 771 marriages or 1542 persons married, 3029 births, 2238 deaths; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. A correction for increase of population has been made in calculating the above results.

season should set in. The localities chiefly influenced and the circumstances in operation are discussed in the summary of the Quarterly Reports (pp. xix—xlii).

Re-marriages.—37,194 persons were married during the year who had been previously wedded; of this number 22,457 were widowers, and 14,737 were widows; of the widowers 14,566 formed alliances with spinsters, and 7891 with widows; while of the widows who re-married 6846 were espoused by bachelors, and 7891 by widowers. Of every 100 men who married, 13·7 had been previously married, and among every 100 women who married there were 9 re-marriages. These proportions are less than those prevailing of late years, and seem to indicate that the causes which operated in depressing the marriage-rate generally

were most seriously considered by those whose experience of family responsibilities was the largest. The proportion of re-married widowers was greatest (17 per cent.) in Suffolk and least (11 per cent.) in Cumberland; the proportion of widows was greatest (12 per cent.) in Monmouthshire, and least (5 per cent.) in Westmorland.

Minors.—10,615 young men and 32,464 young women who were under 21 years of age entered the matrimonial state, being in the respective proportions of 6·5 and 19·8 to every 100 of their sex married during the year. These proportions are in excess of the average, the restraining influence of experience and reflection not being so operative among these young people as among those who had been previously married, or were of a more mature age, and who naturally exhibit greater hesitation to assume the responsibilities of wedded life in times of national depression. In Bedfordshire nearly 16 of every 100 men married were under 21 years of age, while in Hampshire the proportion is less than 2; more than 30 in every 100 females married in Huntingdonshire were minors, and the lowest proportion (12 per cent.) occurred in North Wales.

Signatures of persons married.—It is gratifying to observe that although the number of persons who are unable to affix their names to

1851	·858	5·591	·130	·728	38	6

* Disregarding the decimal point, this will read 804 marriages were celebrated to every 100,000 of the population; of these, 135 may be taken to represent the marriages of the higher and middle classes, and 669 those of the classes below.

the marriage register is greater than could be wished, yet it is year by year decreasing, for while in the year 1845 no fewer than 41·4 in every 100 persons married signed the register with marks, the proportion has been gradually reduced until in 1862 not more than 28·5 exhibited inability to sign their names. Of every 100 males who married, 23·7 signed with marks, while 33·2 in every 100 females who married signed in the same manner in 1862. The proportions in each year, as well as a comparison of the facts for each county, are illustrated in Tables V. and VI. (pp. v, vi.). It will be observed that as regards this test of education the Northern Counties contrast favourably with the rest, Westmorland occupying the most creditable position, and in no other county do the females write so well. At the opposite end of the scale is Monmouthshire, in which county nearly half the people who marry exhibit an inability to sign their names. There is great need of the schoolmaster here, as well as in South and North Wales generally, and it is to be hoped that future years will show that the beautiful principality, which gives the heir to the British throne his renowned title, will not, as now, be conspicuous among the least educated portions of our island. The education of the children of the principality will be retarded so long as they speak the Welsh language in childhood. At the Census of 1851, when the last educational enumeration took place, it was found that the number of scholars attending day schools was 2,144,378, or one in every 8·36 of the population, while 318,000 teachers were engaged in educating 2,407,642 scholars in Sunday schools. Since that time the attention of the government and of the public has in a greater degree been directed to educational requirements, and the examination ordeal which the candidates for even the most subordinate public appointments have now to undergo has also stimulated scholastic progress, so that at the present time we are prepared for the information that the proportion of scholars to population is much greater than in 1851.

The Occupation Abstracts of the Census of 1861 disclose that while the population increased since 1851 12 per cent., the scholars of all ages

43	South Wales - - - - - -	·759	64·1	43·7	6·02	16·98	12·29	8·03
44	North Wales - - - - - -	·700	64·3	48·5	4·62	12·22	14·54	8·62

The Table may be read thus by omitting the decimal points:—In England, among every 100,000 persons living 807 marriages took place; of 1,000 men married 763, of 1,000 women 668, signed the marriage register by writing their names; of 10,000 men married 647 were not of full age, of 10,000 women married 1979 were not of full age; of 10,000 men married 1369 were Widowers, of the same number of women married 898 were Widows.

number of scholars under 5 years of age was doubled in the ten years. This increasing stream passing through the various schools of the country is asserting its presence in the marriage registers, and has reduced the proportion of those who signed with marks, which 18 years since was as high as 41 per cent., to little more than 28 per cent. of those who married in 1862.

The efforts to extend the benefits of elementary education are bearing every year a more abundant harvest of good results, and should encourage us to increase our exertions until every man and every woman shall be able to attach their names to their marriage register.

It is impossible to calculate how much the value of the work of the population is increased by the increase of its intelligence.

Buildings registered for the solemnization of marriages.—During the year 1862 190 additional places of worship of the Roman Catholics and Dissenting denominations were registered for the solemnization of marriages; of these, 36 belonged to the Independents, 24 to the Baptists, 66 to Wesleyan Methodists, 24 to Welsh Calvinistic Methodists, and 21 to Roman Catholics. In 1861 the number of buildings registered was 161. At the close of 1862 there were 4754 buildings on the register, including 1529 (nearly a third of the whole) belonging to the Independents, 1026 to the Baptists, 961 to the various societies of Wesleyan Methodists, and 572 to the Roman Catholics. The distribution of the registered buildings will be seen in the Table. (See Table VIII.)

The marriages in registered buildings in 1862 were 21,215; in the 324 buildings in London 2251 marriages were solemnized, including 1342 marriages in Roman Catholic chapels; in the 627 buildings in the North-western division (Cheshire and Lancashire) there were 5039 marriages, 3141 of which were in Roman Catholic chapels. In the Welsh Division, where the registered buildings are the most numerous, 2687 marriages were celebrated in the 747 chapels, namely 237 of Roman Catholics, and 2450 of other denominations. With regard to marriages in Roman Catholic chapels, it may be remarked that in some instances one of the parties to the marriage is a Protestant.

TABLE VII.—**Number** and **Annual Rate per Cent.** of **Marriages** in **England** in each **Quarter** of the Years **1838–62.**

Births.

The births of 712,684 living children were registered in the year 1862, a greater number than has ever been recorded since the commencement of the Registration system, and the proportional rate to the population (3·504 per cent., or one birth to 29 persons living) has only been equalled once, namely, in 1859, when it was the same to a fraction; the average birth-rate of 25 years is 3·325, or one birth to 30 persons living. Durham usually exhibits the highest birth-rate, the average for this county being 4·121, and in 1862 it rose to 4·197 to 100 persons living; the minimum rate (3·013) was in Herefordshire. The only counties that did not maintain their average rate of births were Middlesex (extra-metropolitan), Cambridgeshire, Staffordshire, Warwickshire, Rutlandshire, Nottinghamshire, and Monmouthshire.

Sex.—Of the births registered, 363,534 were male, and 349,150 were female children, being in the proportion of 104 male to every 100 female children. In several counties the proportion of male to female births was unusually large:—thus in Northamptonshire there were 111 males born to every 100 females, in Huntingdonshire nearly 114 males to 100 females, in Derbyshire nearly 110 males to 100 females. Dorsetshire and Rutlandshire reversed the proportion of the sexes, for in the former county there were 99·9, and in the latter only 97 males born to every 100 females.

Seasons.—There is no recorded exception to the rule that the births registered in the first six months of the year exceed those in the last six months; in 1862 there were 181,990 births registered in the March quarter, 185,554 in the June quarter, 172,709 in the September, and 172,431 in the December quarter. Assuming 1000 to represent the average quarterly number of births, the proportion in the first quarter was 1035, in the second 1044, in the third 961, and in the fourth quarter 960.

Children born out of wedlock.—The births of 45,222 illegitimate children were registered, being in the proportion of 6·3 to every 100 births; 23,033 of the illegitimate births were those of male, and 22,189 female children. In Norfolk the proportion of the illegitimate was 10·5 per cent., Herefordshire 8·0, Shropshire 9·8, Lincolnshire 8·7, Nottinghamshire 9·2, North Riding of Yorkshire 9·4, while Cumberland and Westmorland head the list with the respective proportions of 11·3 and 11·2 per cent., thus disappointing the expectations founded on their favourable educational standing.

Table IX.—**Births** in the **Years 1845–62** in **England,** distinguishing the **Legitimate** and **Illegitimate.**

1861	696,406	652,249	44,157
1862	712,684	667,462	45,222

Deaths.

In 1862 a total number of 436,566 deaths was entered in the English registers. It was less than in 1849, the cholera year, also less than in 1854, another year of that epidemic, less also than in either of the years 1858–9. The increase of deaths with the rising tide of population is such that while there were only two instances, viz. those of 1847 and

1849, in the thirteen years 1838–50 in which the annual number reached 400,000, there are ten instances in the series of twelve years 1851–62 in which it rose above 400,000.

If there had been no efflux of the population to parts beyond the limits of the kingdom in the three years 1860–2 its natural growth within that period, derived from the excess of births over deaths, would have added to its numerical strength a population equal to those of the towns of Liverpool and Birmingham united.

The rate of mortality in the year was 2·147 per cent., having been less by ·064 than the average derived from the ten years 1853–62, which is 2·211.

That the public health was comparatively good in 1862 appears further from the fact that the death-rate was lower in that year than it had been in nineteen out of the twenty-four years that preceded it. One person died out of 47 living. In the healthier year of 1856 one died out of 49.

Sex.—The mortality of males is invariably higher than that of females. Throughout the twenty-five years 1838–62 the mortality of males did not in a single instance fall as low as 2·100 per cent.; the lowest was 2·136

in 1856; whereas that of females was in eleven out of the twenty-five years below 2·100, and in 1856 it was 1·969.

The rates of mortality in the sexes are calculated on the male and female populations respectively. In 1862 the death-rate of males was 2·249 to 100 males living; that of females was 2·049 to the same number of females living. The averages are 2·309 and 2·143. Thus it appears that when the salubrity of the year is viewed in regard to its influence on the sexes, the advantage is found in favour of the females; for the decrease of mortality below the average was greater amongst them than amongst the males.

On an average of twenty-five years 103 males died to 100 females. In 1862 the proportion was 104 to 100. But in all the Eleven Divisions of England, except the Northern Counties, the number of males living was less than that of females; consequently if equal numbers living, belonging to the two sexes, are taken, the proportion is found to be higher than that which has just been stated; it becomes 110 instead of 104 to 100.

In the Northern Division, to which mining operations attract that labour which only men can supply, there were 106 deaths of males to 100 of females. If the population had consisted of equal numbers of the two sexes, the proportion of deaths of males would have been rather less than 106.

London and Counties.—While the mortality of England was 2·147 per cent., that of London was 2·356; that of the West Riding of Yorkshire 2·364. The mortality ranged from 1·645 in Rutlandshire, and 1·662 in the extra-metropolitan portion of Surrey, to 2·560 in Lancashire. The distress amongst the operatives of the manufacturing districts of Cheshire and Lancashire, arising from the shortness of the cotton supply, which was caused by war in the United States, commenced in the latter part of

1860 – –	2·218	2·034	104	109
1861 – –	2·268	2·063	104	110
1862 – –	2·249	2·049	104	110
Average of 25 years, 1838–62 – –	2·309	2·143	103	108

The Table may be read thus:—In the year 1838 to every 100 males living there were 2·342 deaths of males; to every 100 females living there were 2·146 deaths of females; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females;* and that out of equal *numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

1861; but 1862 may be reckoned the first year of that great and wide-spread calamity. The death-rate in Cheshire was 2·246 against an average of 2·219; and in Lancashire, which is five times as populous, it was 2·560 against 2·594. In the West Riding of Yorkshire it rose as high as the average, and in the two other Ridings it was above the average. In Northumberland, Cumberland, and Westmorland it was also higher than the average of each county respectively; and the same is true of North Wales.

It is possible, and even probable that individuals and families of the Lancashire workmen, whose simple annals are unwritten on any page, and unremembered by any but themselves, suffered, while under fever or other sickness, from the want of necessaries or comforts which better times had supplied in greater abundance; and may even have traced prolonged illness or debility directly to that cause. If such cases were numerous, circumstances of a local or general character, and favourable to health, were in operation amongst a large and mixed community, and compensated, in the aggregate of sickness and mortality, for effects which the reduction of diet below the natural standard must necessarily produce. When the cotton manufacture was prosperous, factory labour fed and clothed a vast population, but it was not considered an unqualified good under all the conditions incidental to it;—men deprived of needful recreation in the open air;—children robbed of that nursing which their mothers engaged in the factory could not give. When the collapse came, the temporary intermission of that labour was supposed by many persons to have conduced to the public health by offering opportunities which had previously been denied. To what extent, if any, this was true, is subject of reasonable opinion or speculation amongst members of the medical profession accustomed to study the habits and diseases of families in the neighbourhoods in which they live; but there is no evidence to prove that exercise in the fields, domestic superintendence, and moderation in the use of drinks actually depressed the rate of mortality, though it may be safely admitted that this effect must necessarily follow, when for an adequate length of time such causes have been in operation. Influences that in their wide diffusion reduced the mortality of England below the average doubtless tended to reduce it also in Lancashire. The mean temperature of the air in the year (49·5°) somewhat exceeded the average at Greenwich; while in summer, the only quarter in which the temperature was not in excess, the coldness of the season was beneficial in its effect; and other physical agencies that are more difficult to be appreciated than heat and cold were probably at work. But that the registers did not tell a different tale,—that famine did not bear the fruit which in the history of nations it has too often borne, the spectacle of thousands struck by fever and death,—is mainly due to that legal provision for the poor which Christian civilization has established, and to the spontaneous munificence of a people amongst whom the seeds of charity have been liberally scattered.

The Seasons.—In the winter quarter of 1862, viz., the first three months, the rate of mortality (2·443) was slightly below the average of winter; in the spring quarter it was 2·121 per cent., and showed a greater decrease on its average; in summer the rate (1·800) was singularly low; but in autumn, the last three months, it rose to 2·230, a point higher than the average of twenty-five years.

If 1000 deaths be assumed as the average number in a quarter, the following will be the proportional numbers in England in the four quarters of 1862, as obtained from the actual numbers in that year:—1133 in the quarter ended March 31st, 986 in the June quarter, 839 in the September, and 1042 in the December quarter. In Lancashire the proportional numbers will be 1160, 956, 808, and 1076. In Devonshire 1084, 1040, 860, and 1016. In the West Riding of Yorkshire 1064, 996, 856, and 1084. In London 1080, 928, 916, and 1076. It appears from these figures that in the fluctuations of mortality caused by seasonal influences, Lancashire was particularly indebted to summer; that it suffered most in the winter quarter; that in London the winter and autumn quarters were alike, while the two intermediate quarters scarcely differed; that in the West Riding the autumn and winter quarters were the most unhealthy; and that Devonshire, while, like other places, it received most benefit from the summer, experienced a more equable rate of mortality in the course of the year than other parts.

Mortality of Males and Females at the various periods of Life.

Tables XVI. to XIX.

We have from the three Censuses of 1841, 1851, and 1861, in which the ages of the population were enumerated, the means of determining very nearly the numbers living in each of the twenty-five years (1838–62) during which the registration of deaths has been in operation.

The specification of the numbers living at each separate year of age is, except as a matter of curiosity, utterly useless, for in the first place great numbers of the people do not know their exact age within a year or two, and in the second place the actual numbers at each year of age fluctuate considerably from various causes, and an annual Census alone could supply the true numbers living for each year. By collecting together all the numbers returned in each five years of age under fifteen, and in each ten years after that age, groups of population are obtained at the censuses, of sufficient magnitude to allow us to determine the years of life, and the rate of mortality at each important period of life in each of the twenty-five years. The weight of the results is increased by the extended area of observation, which covers the whole of England and Wales, for a quarter of a century.

The deaths vary considerably in number in the various groups; thus under the age of 5 the number of boys dying ranged from 70,000 to 100,000 annually; at the age 10 and under 15, the deaths of boys ranged from 4200 to 6100; while at each of the decennial periods afterwards, from 15 to 85, the number of deaths ranged from 10,000 to 21,000; in the decennium, from 85 to 95, the numbers fell to 4000 or 5000; and for 95 and upwards are about 200 to 300 men, and twice as many women.

The mortality of the two sexes differs considerably at different ages; thus in the first five years of life the excess of mortality among boys over that of girls is in the ratio of 7·216 and 6·216, or 1·000 per cent.; in the next period it is only slightly in excess; but from the age of 10 to

* For mode of reading this Table, see Note to Table XVII.

Note.—Tables XVI. to XIX. should be substituted for Table XV. in the 22d and previous Annual Reports. The Population used in the above calculations now being deduced from the ascertained rate of increase observed in the 20 Years 1841–61.

25 and 35, the young women die in a greater proportion than young men, the cause of which it is important to investigate; at the age of 45 and upwards, the women die at a lower rate, and live longer afterwards than men.

The mean mortality among boys of 10–15 is at the rate of 5 in 1000; of young men in the next ten years (15–25) the mortality is somewhat less than 8 in 1000, and in the following decennial periods the numbers dying per 1000 run up to 10, 13, 18, 31, and 67 (at the age of 70=65–75), 147, 303, and 436, which is the rate carrying off the old men of 95 and upwards.

The mortality among women goes through similar variations.

It will be observed that the mortality at the same periods of life fluctuated. Thus while the mean mortality of boys under five years of age was 7·216, their mortality in the year 1846 was as high as 7·781, and in 1845 as low as 6·683 per cent. The one was ·565 above, the other ·533 below the average, making the total range in the rate 1·098.

Generally at all ages, from 5 to 65, the mortality was highest in the year of the great cholera epidemic (1849), and lowest in the years 1856, 1860, and 1861.

The mortality rate never falls so much below the mean mortality as it is raised above it by epidemics especially, and while the absolute difference of the rates is naturally greatest at the advanced ages, when the rates themselves are high, the relative rise and fall is greatest in

The Table may be read thus:—Of 100 males living of the age 35 and under 45, 1·358 died in 1838, 1·265 in 1839, and 1·162 in 1850; the average annual rate in the 25 years, 1838–62, among the aggregate of males in this decennial period of age was 1·272.

childhood after the age of 5 years and under 15, when the zymotic diseases of that age are most prevalent. Women of the age of 15 and under 45 were cut off in great numbers in the cholera years.

The following are examples of the fluctuations of the rates of mortality in the twenty-five years.

The mean annual mortality of men of the age 25–35 was ·975, but the mortality of men of that age in 1849 was 1·236, and in 1850 it was as low as ·877 per cent. The range was ·359; in the one case it was more than 26 per cent. above ·975, and in the other 10 per cent. below that mortality rate.

The mean annual mortality of men of 55–65 was 3·136, but in 1849 the rate was 3·653, in 1850 it was 2·979; thus the range was ·674 in the twenty-five years.

An Insurance office upon a large number of these lives of 55–65 would pay at the rate of 31 policies in 1000 during ordinary years, but it may pay on 37 or 30 deaths in years of high or low mortality. The relative fluctuation is greater when small numbers are concerned.

Meteorology.—At fifty degrees latitude the mean temperature of the air was 50·6°, at fifty-one degrees 49·3°, at fifty-two degrees 48·7°, at fifty-three degrees 47·6°, at fifty-four degrees 46·1°, at fifty-five degrees 45·7°. Between south and north there was a difference in mean temperature amounting to 5°, or one less for every stretch of sixty geographical miles northwards. The mean temperature of the dew-point fell constantly from 45·8° at fifty degrees latitude to 42·1° at fifty-four degrees. The mean elastic force of vapour from ·316 to ·276.

At nearly all the fifty-two meteorological stations westerly winds prevailed, and taking one station with another, from Guernsey and Truro in the south to Shields and Alnwick in the north, the wind blew from a westerly point on 133 days out of the 365, from the east on 70 days, from

the south on 84, and from the north on 78. But it blew from a northerly point nearly a third part of the year at Truro, and even more at Worthing. Southerly winds prevailed more or as much as northerly in some parts.

The amount of rain collected at Greenwich was 26 inches; at Truro, Bath, Barnstaple, Silloth, and Allenheads, about 45 inches; at Stonyhurst 55 inches; at Scarborough, Leeds, Grantham, Holkham, little more than 20 inches. The average rain-fall in England as represented by the fifty-two stations was 31 inches.

Summary of the Quarterly Reports, 1862.

First Quarter.—January, February, March.

The marriage-rate, which had been low during the whole of the previous year 1861, continued low in the first quarter of the year 1862. The births were numerous in the first quarter of the present year, as they had been in 1861; and the rate of mortality, which was comparatively low in the last two years, was not high in the first quarter of the year. The marriage-rate in 1861, and the increase of pauperism in the same period, concur to indicate a less prosperous state of trade and industry in the community; but physical causes, and improvement in sanitary condition, appear to have exercised a favourable influence on the public health.

Marriages.—In the first three months of this year 67,906 persons were married in England. They married at the rate (per annum) of 1·360 in a hundred of the population, whilst the average of corresponding quarters in the years 1852–61 is 1·41. But the marriage-rate was not so low as it had been in the same quarter of 1858, when it declined to 1·252, and when, to quote the words of the Report of that period, "the stagnation "of trade in the manufacturing districts had cast a shadow over the "prospects of the people, and they did not marry."

The population of Lancashire has undoubtedly increased during the last five years, and while this circumstance is borne in mind, it may be stated that the marriages in that county in the winter quarter of 1858 were 4157; in that of 1860 they were 5524; and in the same quarter of this year 4882.

It may be anticipated, that when the marriage results in Lancashire for the June quarter are ascertained, the effect of a season of depression worse than that of 1858 will be manifested in the returns more conspicuously.

By comparing the numbers of marriages in the winter quarters of 1861–2, it will be seen that there was an increase in London and in the ten other divisions of England, with the exception of the Eastern Counties, where there was a decrease, of the North Midland Counties, where the number was stationary, and of the North-western counties, where there was an important decrease in consequence of a reduction of the marriage-rate in Lancashire, which forms the chief part of the division.

In Liverpool the marriages decreased from 828 in the winter or March quarter of 1861 to 785 in that of 1862; in Wigan from 228 to 186; in Bury from 210 to 173; in Chorlton from 131 to 91; in Salford from 143 to 126; in Manchester from 951 to 829; in Ashton from 278 to 225; in Oldham from 215 to 172; in Rochdale from 223 to 169; in Haslingden from 170 to 142; in Burnley from 185 to 128; in Blackburn from 259 to 216; in Preston from 265 to 220. In the iron district of Ulverston, in the north-west of Lancashire, the marriages appear to have been fairly maintained; and the report of the Registrar of Dalton in that district is cheerful amid the gloom. He says:—"There is no distress in the sub-

" district; men are fully employed, and wages are good according to the " price of food."

Births.—The total number of births in the first three months of this year was 181,990; in the same period of last year it was 172,933. The birth-rate, 3·644, was higher than in any of the years 1852–61, with the exception of 1860; the average rate is 3·59.

By a review of results in the Eleven Divisions it will be seen that in seven of them the number of births was less last quarter than it had been in the corresponding quarter of 1860; that in London, and in the South Eastern Division, the numbers were slightly higher; in the North-western Division the number was higher by nearly 2000; in the Northern Division also the births exhibited an increase.

In connexion with the above statement it may be observed here that in comparing the same two periods the absolute numbers of deaths were less in 1862 in all the Divisions except the two last mentioned, viz., the North-western and the Northern, which embrace Cheshire, Lancashire, Durham, Northumberland, &c. The conclusion is that generally where the quarter was more fruitful than that of 1860 in respect of births it was also unfortunately distinguished by more numerous deaths. Where many children were born, many died; and their names were enrolled on both sides of the account. To this circumstance the tabular results are probably to some extent due. But the observation is not applicable to certain towns in the North-western Division, for in Stockport, Manchester, and Salford, there was a decrease of births and a great increase of deaths.

The following report is from the registrar of—

Coventry; *Holy Trinity*, sub-district.—Births 160; Deaths 93. There is a very perceptible diminution in the number of births within my district since the commencement of 1861. Thus, for the five quarters ending 31st December 1860, the number of

The Table may be read thus, without reference to the decimal points:—In the March quarter of the year 1838, to 100,000 of the population of England there were 3,032 births, and 2,615 deaths registered. The three months January, February, March, contain 90, in Leap year 91 days; the three months April, May, June, 91 days; each of the two last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

births was 1011; while for the 5 quarters just ended, 31st March 1862, the number was only 850. I attribute this decline in the number of births to the circumstance of many young married couples having emigrated, or left Coventry in consequence of the extreme depression of the ribbon and watch trades.

Increase of Population.—The excess of births over deaths constitutes a natural increase of the population. This excess in the quarter was 59,971, which is equal to a daily average of 666.

In the first three months of this year the total number of emigrants who sailed from ports in the United Kingdom where there are Government Emigration Officers was 15,159, of which 5197 were persons of English, and about 8000 of Irish origin. English emigrants left these shores at the rate of 58 daily. About two-thirds of the English went to the Australian Colonies.

The emigration to the Australian Colonies which had been much reduced as well as the emigration to all parts, exhibits some appearance of revival, while that to the United States continues rapidly to decline. In the quarter that ended 31st March emigrants (English, Scotch, Irish, and Foreign) to the Australian Colonies were 4411 in 1860, 3227 in 1861, and 6322 in the present year; to the United States there went in the same periods 15,117, 12,156, and 7210. The last number forms not more than the sixth or seventh part of the emigration to the same part of the world ten years ago.

Prices, the Weather, and Pauperism.—The average price of wheat per quarter was 60*s.*; it was higher than it had been in any quarter since 1856. In the March quarter of 1860 and 1861 the price was 44*s.* 5*d.* and 55*s.* 1*d.* Potatoes were not cheap; they were on an average 142*s.* 6*d.* per ton. Beef was at the same price as in the same period of last year; mutton was a penny per lb. cheaper.

The mean temperature of the air at Greenwich for the three months was 41°·1 (which was also the temperature of February); it was 1°·6 above the average of 21 years. The mean temperature of each month was above the average; the highest temperature recorded was obtained at Bournemouth, near Poole, where the thermometer reached 70° in March; the lowest was registered at Holkham; it was 11°·8, and occurred in March.

The character of the weather as it was observed at Greenwich is thus described by Mr. Glaisher:—"During the whole of the past three months "the temperature of the air has been for a few days together cold, and "then for a few days together warm, and so on alternately; the former "or cold periods have varied from five to nine days, and the warm from "seven to nine days, with one of fifteen days. The warm periods have "generally been of somewhat longer duration than the cold periods, and "have also been generally more in excess of the average than the cold "periods have been in defect, so that upon the quarter the temperature "has been in excess, and would class as a warm period. I have no recol-"lection of such a succession of hot and cold periods of nearly equal "lengths.

"The fall of rain in January was 1·9 inch, in February 0·5 inch, and "in March 3·7 inches; the total fall for the quarter was 6·1 inches, "being about 1¼ inch above the average of the preceding 45 years. The "fall in February was nearly the smallest which has occurred in this "month since 1815, it having been less on three occasions; viz., 0·04 inch "in 1821, 0·4 inch in 1834, and 0·2 inch in 1857. The fall in March "has been exceeded twice since 1815, viz., in 1818, when it was "3·8 inches, and again in 1851, when it was 4·1 inches."

It is stated that at Belvoir Castle the land was in excellent condition for farming operations in January and February; but the wet weather at the latter end of March prevented all out-door work. Wheat looked well in favourable situations. Influenza had been prevalent among horses in January and February, and was fatal in many cases. At Culloden

ploughing was completed about the middle of January on many farms; wheat had an early and rapid growth, and looked well. At Harrogate vegetation was very forward.

The registrar of Wells in Norfolk mentions "the continuance of a very "damp and cold atmosphere," to which he attributes "fever of a low type "and diphtheria, which often proved rapidly fatal." The registrar of Salisbury believes that the excess of deaths which he records was partly caused "by the trying weather which we have had of late." "The "increase of deaths," says the registrar of Lansdown (Bath), "is un-"doubtedly owing to the frequent and sudden changes of the weather "during the past remarkable winter, when the thermometer frequently "ranged 20° or 30° in the course of 24 hours." Variable or otherwise unfavourable weather is reported to have had a similar effect at Bilston, Darlaston (Walsall), and at Birmingham. At Lincoln, where cases of scarlatina were numerous but not fatal, the weather was "extremely damp and unhealthy." At Liverpool pulmonary complaints were supposed to have resulted from damp and changeable weather, aided by privation, which the poor had suffered. At Royton (Oldham) the weather had been very wet, working time short, and the mortality more than double the average. Changeable weather and want of employment had caused much fatal sickness at Crompton in the same district. Wet, cold, and changeable weather had raised the mortality in Lancaster, at Thornton and Wilsden (Bradford), at Malton, Whitby, and Northallerton; Middleton and Chester-le-Street in the county of Durham suffered from the same cause. The registrar of Newport in Monmouthshire states that "the "quarter has been wet and cold to an unusual degree, and chest diseases had prevailed;" and at Kington in South Wales, where there was a great deal of sickness from scarlatina and diphtheria, the medical men attributed it to the unsettled state of the weather.

The Returns of the Poor Law Board bear faithful witness to the distress that unhappily prevails in many districts. The average number of in-door paupers relieved on the last day of each week rose from 118,523 in the March quarter of 1860 to 143,772 in the corresponding quarter of this year; that of out-door paupers from 717,269 to 804,268. The increase which the last returns show was very manifest, though not to an equal degree, in the March quarter of the intermediate year 1861.

Deaths; and State of the Public Health.—The total number of deaths registered in the quarter was 122,019; it was not so great as in the same quarter of 1860, when the number was 122,617. London returned 18,191 deaths; Lancashire, which has a population less by upwards of three hundred thousand persons, returned 18,650. If the rate of mortality had been the same in Lancashire that it was in London, the deaths in that county would have been about 16,000.

The rate of mortality was lowest in the South Eastern Counties, which include Sussex, Hampshire, Berkshire, and the extra-metropolitan parts of Surrey and Kent; and in the South Western, which include Wiltshire, Dorsetshire, Devonshire, Cornwall, and Somersetshire; it was higher in the Eastern and North and South Midland Divisions; higher still in the West Midland. The highest rates of mortality prevailed in Yorkshire, the Northern Counties, Monmouthshire, and Wales; in London; and in the North-western Division, which includes Cheshire and Lancashire. The last-mentioned Division is unfavourably distinguished above all the rest.

The rate of mortality in England and Wales in the quarter was 2·443 per cent.; the average being 2·49. It ranged in the March quarter of the previous ten years from 2·2 to 2·9.

In the districts that comprise the chief towns, the rate of mortality was 2·655 per cent. against an average of 2·683. In those that consist chiefly of small towns and country parishes the rate was 2·184, against

an average of 2·278. The country was not only favourably distinguished from town by having a rate of mortality which was lower by five deaths in each thousand of the population ; it also appears to have attained a higher degree of salubrity as compared with that which had been experienced in the winters of former years.

The quarter, for which the present return is made, was at least as healthy as the same period in 1861, and more healthy than that of 1860. Taken as a whole, the season was warm, and "the wet," which is so much the subject of complaint in the local reports, was probably an evil that was not without its wholesome mixture of good. But Lancashire, as has been already mentioned in general terms, has tended to darken the aspect of returns, which viewed in the aggregate are not unfavourable. In the last three corresponding quarters the deaths in that county considerably increased ; they were in the first 16,024, in the next 17,408, and in the March quarter of the present year 18,650.

Of twenty-six districts of which Lancashire consists, there was in twenty-four an increase of the deaths now returned over those of the March quarter of 1860 ; and in seventeen an increase over those of the same quarter of 1861. In Leigh the deaths in the three corresponding quarters were successively 273, 274, and 339 ; in Bury 591, 695, and 802 ; in Salford 706, 632, and 817 ; in Oldham 692, 809, and 890 ; in Haslingden 400, 422, and 490 ; in Burnley 500, 531, and 603 ; in Blackburn 727, 850, and 996; in Preston 823, 876, and 886 ; and in Manchester 1760, 1775, and 2312. In Stockport the deaths in the same periods were 651, 589, and 711.

The registrars in certain districts refer the increased mortality which these figures too plainly reveal, to scarlatina, measles, bronchitis, and pneumonia, which had been prevalent ; and by some of them an opinion, which there is reason to fear may be too well founded, appears to be entertained that those complaints had found an active ally in the poverty and want which many of the unemployed thousands now suffer in the great seats of manufacture. Facts have been adduced to prove that in instances of great depression of trade like that which recently occurred in Coventry the mortality of children is reduced in consequence of the due amount of maternal care being bestowed on them which in more prosperous times is withdrawn by the importunate requisition of factory labour. This is within limits. Nursing in straitened circumstances may be better for children than fulness of good cheer without it ; but when hard times are prolonged, and the small store that had been gathered in the day of full work is exhausted, the greatest amount of parental attention will not expel physical decline, sickness, or death itself from the dwelling.

The following reports are from Registrars of the district of Stockport :—

" *Hyde.*—Births 183 ; Deaths 163. The deaths are above the average, 14 occurred " from scarlatina. There has been great privation and distress among the factory " operatives, arising from want of employment."

" *Stockport, First Part.*—Births 239 ; Deaths 253. The deaths are more than the " average. Measles, whooping-cough, pneumonia, and bronchitis have been prevalent, " and caused many deaths amongst young children. I have had an increased number " of deaths at the workhouse, in consequence of the present depressed state of trade " having augmented the number of inmates."

" *Stockport, Second Part.*—Births 97 ; Deaths 126. The mortality is considerably in " excess of that of the corresponding quarter of 1861, when the deaths were 78. The " increase is attributable to the prevalence of whooping-cough 17, and bronchitis 19. " The state of the cotton trade, the staple of this district, may have had some effect. " The Board of Guardians, aided by private benevolence, has, however, done much to " mitigate privations consequent on the suspension of employment."

The Registrar of Preston writes thus :—

" Births 932 ; Deaths 710. The deaths are 72 above the average of five corresponding " quarters. 362 children died at and under 5 years of age. During the last three " months great distress has existed in this district in consequence of the insufficient

" supply of cotton. Several thousands of the operative classes have been out of work, " or only partially employed. From a statement published March 12th it appears that " there are 1,645,830 mule spindles in the cotton factories, of which 533,706 were " entirely stopped; the rest 1,112,124 were working from 3 to 6 days per week. There " are 27,186 power looms for the manufacture of cotton cloth, of which 9033 were " stopped; the rest 18,153 were working from 3 to 6 days per week. The loss of wages " alone to the operatives is estimated at 7000*l.* per week. Great efforts have been made " by the benevolent to relieve the distress, and a large sum of money has been raised. " The operatives at several establishments working full time have manifested a truly " fraternal feeling towards their less fortunate fellow workmen, by contributing towards " their relief. Amongst others, those employed at the extensive cotton mills of Messrs. " Horrocks, Miller, and Co., have presented the noble sum of 225*l.* 4*s.* 4*d.* In the week " ending March 29th, 3149 cases, comprising 14,314 persons, were visited and relieved " from this fund. Too much cannot be said in favour of the distressed operatives " for their patient and orderly conduct in the midst of their privations and sufferings."

Second Quarter.—April, May, June, 1862.

The leading facts that are disclosed in this return are of a mixed character; they are favourable generally, as regards the health and growth of the population, but they are not without indications of a diminished prosperity in important districts of the country. Marriages were not numerous in the spring quarter of this year. During a period of eighteen months, embracing the whole of 1861 and the earlier half of the current year, the marriage-rate was low, and the concluding three months exhibited a remarkable inactivity of the rate at which new families are formed. Births were numerous in the three months that ended 30th June. A birth-rate above the average degree of activity has prevailed during the last fifteen months. The mortality was below the average; and it is satisfactory to add, that the healthy summer of 1860 inaugurated a period which has been extended through two years, and in which the mortality has not in any quarter reached the average. Atmospheric agencies of a beneficial character have been at work in that time; but public bodies that have projected and successfully carried out local improvements may claim the credit of having contributed in a great degree to produce this result.

Marriages.—The total number of marriages in the spring quarter of 1860 was 43,777; in that of 1861 it was 42,012; and in the same quarter of the present year it fell to 40,853.

The annual marriage-rate in the spring quarter of this year, viz., persons married to a hundred in the population, was 1·614. This proportion is lower than any result obtained in the same season during an extended series of years, for in the ten years 1852–61 it fell to its lowest point, which was 1·638, in 1856; and the average of the whole series is 1·71.

It will be seen that the whole of England and Wales, for the metropolis hardly constitutes an exception to the rule, has been affected more or less in its different parts by the operation of circumstances unfavourable to marriage, and that in the eighth division (comprising Lancashire and Cheshire) which in its present state of adversity will first excite attention in the observation of results that are to be obtained from the tables, the decrease of marriages is more striking than it is in any other of the groups of counties which form the eleven divisions. It may be remembered that a decrease of marriages in the cotton manufacturing districts in the first quarter of the year was mentioned in the last Quarterly Report.

In the three spring quarters of 1860–2 (ending 30th June) the marriages in Cheshire numbered respectively 993, 940, 917; those in Lancashire in the same times were 6331, 6115, and 5484. By comparing the marriages in both counties, the number in last spring with the mean of the number in two preceding springs, it is found that the decrease is equal to 11·0 per cent.

By a similar mode of comparison the next greatest decrease occurred in the Eastern Counties, Essex, Suffolk, and Norfolk, where it was 9·2 per cent. Sussex may be mentioned as an example of a single county in which there was a decrease of equal amount.

The decrease in Monmouthshire and Wales was 4·6 per cent.; in Yorkshire it was 4·0. The Northern Counties also show a decrease, but it was less than one per cent. London stands alone in the eleven divisions as presenting an example of increase, but as this was only one per cent. in an ever-growing population the marriage-rate even in the metropolis was not unusually brisk.

The decrease in the marriages of all England was 4·8 per cent.; and it may be inferred from the above facts that a large portion of that class of the population by which families are established did not consider that their circumstances justified the formation of fresh alliances. Lancashire in its season of calamity has borne witness to the operation of a law of prudence which has not been without its effect in most of the other parts of the kingdom.

Lancashire is divided into twenty-six districts, and of these there appears to have been in West Derby alone a continuous increase of marriages in three June quarters (1860–2); the numbers in that district were 375, 433, 460. The numbers as returned by some of the more important districts, and showing a decrease, may be stated,—Liverpool 1058, 997, 967; Prescot 137, 139, 126; Wigan 198, 223, 174; Bury 226, 221, 186; Salford 161, 159, 145; Manchester 1245, 1161, 1052; Ashton 352, 284, 220; Oldham 207, 233, 195; Haslingden 167, 173, 145; Burnley 166, 159, 141; Blackburn 346, 315, 200; Chorley 95, 88, 67; Preston 325, 289, 213.

The returns of Ashton, Blackburn, and Preston may be selected from the list as signal instances of the marriage-rate being depressed when *hard times* have fallen on the industry of a people.

Births.—The number of children born in the spring quarter (ending 30th June) was 185,554. The birth-rate was 3·665 to a hundred of the population. The average rate is 3·57. If last quarter is compared with the corresponding quarter of 1861 it will be found that the birth-rate was nearly the same in the two periods. But assuming that there was an increase of population within the last year in each of the eleven divisions, there was a decrease of the birth-rate in London in last spring quarter on that of the same quarter in 1861; there was also a decrease in six other divisions; whilst the birth-rate increased or was tolerably well maintained in Lancashire and Cheshire, in Yorkshire, in Durham, Northumberland, and Wales.

The general result, that the birth-rate exceeded the average, appears to be chiefly due to the Northern parts of the kingdom.

London returned 24,692 births last quarter; Lancashire with a less population returned 25,921. Births were numerous in Liverpool.

Increase of Population.—The births in the quarter exceeded the deaths in the same time by 78,162; and the population, if it had been free from disturbance by migration, would have increased at the rate of 859 persons daily.

Last quarter 47,112 persons, of whom about 14,296 were of English origin, and nearly twice that number were Irish, left ports in the United Kingdom at which there are Government Emigration Officers, for the United States, the Colonies, and other parts.

The emigration to the United States has, during a succession of years, suffered a rapid rate of reduction, but last quarter the number of persons who went thither slightly exceeded that of the same period in 1861. But the emigration to British North America has in late years been constantly on the increase; and that to the Australian Colonies gained last quarter a considerable accession. Notwithstanding these fluctuations the return

shows that the United States still received more than half of the emigrants who sailed from these shores.

Prices, the Weather, and Pauperism.—The average price of Consols was $93\frac{3}{4}$, which is higher than it had been in any quarter since the middle of 1860. The average price of wheat per quarter was 56*s.* 8*d.* It was higher than that of the same period in either of the two previous years. The mean price of beef sold by the carcase at Leadenhall and Newgate markets was 5*d.* per lb.; the best quality was 6*d.*, and cheaper than it had been, taking the average quarterly prices, for a considerable time. The highest and lowest prices of mutton, if the means are taken, were 5*d.* and 7*d.*, and were lower than the prices of the June quarter in the last two years.

Mr. Glaisher in his Report on the Weather states that at Greenwich the warm weather which set in on the 24th of March continued till the 7th of April; it was followed by a cold period of eight days duration, after which, on the 17th, very warm weather began and with occasional interruptions continued till the 8th of June. On 25th April the mean temperature was 12°·6 in excess of the average of that day, and on several days in May also the excess was remarkable. Cold weather commenced on the 9th of June and continued till the end of the month. The mean temperature of April was higher than that of any April since 1854; that of May was higher than it had been in this month since 1848; whilst the June of this year was the coldest that has occurred since 1854. The mean temperature of the three months was 53°·3, which slightly exceeds the average of the same period in twenty-one years. The amount of rain at Greenwich was 7·4 in. More than the average quantity fell in April. Snow fell throughout the greater part of the country on the 12th and 13th of April; at Guernsey and Brighton on the 14th April; and at Grantham on 9th May. The heaviest falls of rain were at Stonyhurst, Allenheads, and Cockermouth. At the first of these places the amount in the quarter was nearly 15 inches.

Some remarks on the progress of vegetation and the state of the crops have been made by observers at several of the meteorological stations.

The tables of pauperism exhibit heavier totals. The quarterly averages of the number of in-door paupers relieved on the last day of each week in the June quarter of 1860 were 107,050; in that of 1861 they were 117,801; and in that of the present year 127,861. In the same three periods the out-door paupers rose according to the following numbers:—

692,384;
713,786;
782,113.

Deaths; and State of the Public Health.—The total number of deaths registered in the three months was 107,392. In the same period of 1860–1 the numbers were respectively 110,869 and 107,558; whence it appears that in an increasing population decreasing numbers were entered in the records in the last two spring quarters. The annual rates of mortality in the three seasons now compared were 2·237 per cent.; 2·147; 2·121. The average obtained from returns in ten years is 2·20 per cent. The weather generally was favourable to health; and in many parts the purifying agency of rain was supplied in aid of sanitary expedients, or perhaps as a partial remedy for the want of them.

The rate of mortality in the districts which comprise the chief towns was 2·267. In the small towns and country parishes it was 1·940. These rates may be compared with their respective averages, which were 2·349 and 2·040. The benefit was equally shared between town and country.

When the eleven great divisions of England are compared, London, which is one of them, is found to have held last quarter nearly a middle

position in respect of mortality. Its chief zymotic malady was typhus, which numbered about a thousand victims.

The mortality was greatest in the North-western division, which consists of Cheshire and Lancashire, and where the death-rate was 2·418 per cent. The South-eastern counties, viz., Sussex, Hampshire, Berkshire, and the extra-metropolitan parts of Surrey and Kent, were the healthiest division; and the rate of mortality that prevailed there was 1·742, and presented a striking contrast to that of the North-western division, which besides the great seats of manufacture contains the town of Liverpool.

In adverting to these facts it is important to observe that the high mortality of Lancashire is not a newly discovered phenomenon, the cause of which might probably be found in the distress that prevails in that county at the present time. It may be traced in the annual tables of mortality during a long series of years. The average rate of mortality in Lancashire in the ten years 1851–60 was 2·630 per cent. In 1852 the death-rate rose to 2·865; but with increased attention paid to the public health the returns of later years have shown more favourable results.

It was noticed above that the depression of trade in the manufacturing districts had sensibly affected the marriage returns; but happily it does not appear that the same cause, acting in the opposite direction, has tended materially to raise the rate of mortality; and it cannot positively be asserted that it has produced that effect in any degree. England, as has already been mentioned, was generally rather healthier last quarter than in the same season of 1861; but the rate of mortality in Cheshire and Lancashire was, though in an inconsiderable degree, higher last quarter than it had been in the Spring of the previous year. The difference was only between 2·397 and 2·418.

The registrars of the North-western Counties possess the means of personal observation, but they have only in a few instances ventured remarks on manufacturing distress in connexion with the mortality; and some of them have arrived at opposite conclusions. In Hyde, a sub-district of Stockport, the deaths were above the average, and the registrar believes that some of them were caused "by privation arising from the "want of employment." Another registrar of Stockport states that measles was prevalent and very fatal in May, but the mortality in his sub-district was not maintained in excess till the end of the quarter; it became very low in June. The registrar of Bollington (Macclesfield) mentions that fever prevailed to a serious extent in April and May, in Oldham-street, which is mostly inhabited by a very poor class of persons, and he adds that "perhaps the privations they have endured caused the "fever to spread more widely than it would otherwise have done." In Wigan there were cold winds with heavy rains in June, and distress prevailed greatly and was on the increase; but nevertheless the deaths were much below the average. The registrar of Walton-le-dale (Preston), where the deaths were much below the average, though the cotton mills were almost entirely stopped, holds it not improbable that the health of his sub-district had been improved by the able-bodied poor being employed in out-door labour. In the last week of June public relief was extended to a fifth part of the population. The registrar of Preston writes thus:—

"Births 956; Deaths 595. The deaths are 33 less than in the corresponding quarter "of last year, and 4 more than the average for the last five corresponding quarters. "299 children died at and under five years of age. Distress amongst the operatives in "this district has considerably increased, both in extent and intensity, during the past "three months. There are now upwards of 22,000 persons out of employment, and "entirely dependent upon private charity or the Board of Guardians for support. In "the week ending June 14th, 17,244 persons were relieved by the Relief Committee. "But it is gratifying to know, that, notwithstanding so much poverty, the rate of "mortality has not increased, but decreased. During that week I registered 30 deaths, "and in the corresponding week of last year, when the cotton mills and other establish-"ments were in full operation, and working people well employed, 56 deaths were "registered."

Typhus or typhoid fever has prevailed in certain localities where it is reported to have existed in conjunction with bad sanitary condition. These places are:—Weston Colville in Cambridgeshire, Hadleigh in Suffolk, Holt in Norfolk, Willingham (Gainsborough) in Lincolnshire, Horsforth in the West Riding, Northallerton in the North Riding, and Bridgend in Wales. Measles was a common complaint; it was very fatal in the village of Weston near Hitchin, and at Burnham near Slough; and small-pox prevailed much in Bradford and Lowestoft.

The extra-metropolitan part of Kent appears to have enjoyed unusual health; for the deaths in that portion of the county declined from about 2600 in each of the two preceding springs to 2323 in the same season of this year. But the health of Gravesend, one of its towns, was not equally good; in which district the deaths rose from 85 and 96 to 115, in consequence of scarlatina, which numbered 19 fatal cases in the quarter, and, as appears from a subsequent report of the registrar, continued its ravages in July. A house is mentioned, 5 Russell-street, Milton, in which two children died of scarlatina last November, and three last month; and at the date of the report the mother and two others of her children had been attacked by the disease.

Third Quarter.—July, August, September, 1862.

Though the marriage-rate was fairly maintained in London and some other parts, it was so much depressed in Lancashire that the general result was lower than the average. But the birth-rate was well maintained in the last summer quarter, and in each quarterly period during the last eighteen months children were born in a number exceeding the average. It is still more satisfactory to add that the health of last summer was unusually good. The death-rate has not risen above its average in any quarter of the year since June in 1860.

Marriages.—There were 40,600 marriages in the third quarter of the year. In London the number rose from 7708 and 7322 in the third quarter of 1860–1 to 8082 in the same period of 1862. This increase occurred at a time when the Exhibition was an inducement to part of the permanent population to remain in town, and attracted strangers from the provinces, and more distant parts, to spend some weeks of leisure within a convenient distance of its precincts.

In Lancashire the marriages, which were 6315 and 6127 in the third quarter of 1860–1 respectively, declined to 5475 in that of last year. The following are some of the more important districts in that county, with the number of marriages in the quarter ending 30th September of each of the last three years:—

	1860.	1861.	1862.
Bolton	287	301	236
Bury	229	185	167
Chorlton	142	128	140
Salford	161	154	141
Manchester	1,194	1,157	1,018
Ashton	350	365	220
Oldham	243	221	184
Rochdale	218	221	158
Burnley	204	184	175
Blackburn	338	306	243
Preston	298	257	249

The marriages in Stockport, in Cheshire, show a clear decrease in 1862; they were 291, 301, and 204.

It has been stated that Ashton-under-Lyne stands at the top of the scale of pauperism; and if marriages are expected to be fewest where distress is greatest, the returns fully justify that expectation. In Ashton

the decrease on the two previous summers was no less than 38 per cent. Next in respect of decrease is Stockport, where it was 31 per cent. The marriages of Rochdale decreased 28 per cent.; of Chorley 28; of Leigh 24; of Blackburn 25; of Oldham 21; of Bolton 20; of Bury 19; of Manchester 13; of Salford and of Haslingden 11 per cent. In Preston and Burnley they decreased 10 per cent., and in Wigan the decrease was 9 per cent. Chorlton showed a slight increase. When the marriage returns for the year are completed, they may be compared with the amount of pauperism, namely, the proportion which the persons relieved from the local rates and the funds of Relief Committees bore to the whole population.

Births.—The total number of births in the quarter that ended 30th September was 172,709. It showed an increase of 4632 above the mean of two previous summer quarters (1860–1). The birth-rate was 3·365 per cent. of the population, against an average of 3·29 in ten corresponding quarters (1852–61).

In Cheshire and Lancashire the numbers of children born in three summer quarters were 25,691 in 1860; 27,233 in 1861; and 28,029 in 1862. The last number as compared with the mean of the two previous numbers represents an excess of 5·9 per cent. This increase is higher than that shown by any other of the groups of counties distinguished as the "Eleven Divisions." This fact is the more remarkable, because it is probable that not a few of the industrial population had left their homes for Yorkshire and other parts in quest of work, and that comparatively few persons arrived to settle in the districts of the cotton manufacture; while it can be shown that in other parts where the population increases even more rapidly, the increase of births was less than it was in Lancashire; as, for example, in the Northern Division the births increased only 2·8 per cent., and in London about one per cent. The increase which was next to that of Cheshire and Lancashire occurred in the Welsh Division.

Though London contains 300,000 more people than Lancashire the number of children born in the former was less than that of the births returned by the latter. The respective numbers were 23,253 and 23,761.

Increase of Population.—The excess of births over deaths in the last quarter was 80,328. The natural increase of the population was therefore at the rate of 873 daily. As the stream rises, part of it overflows into other regions of the globe.

The number of emigrants to all parts who left ports in the United Kingdom where there are emigration officers, in the three months that ended 30th September, was 33,240; and in this number the English emigrants may be stated approximately as 12,866. The emigration to the Australian colonies has much increased; the English, Irish, Scotch, and others who went thither last quarter was 12,071; in either of the two previous summers they were little more than 7000. British North America also drew a larger company. The number who sought the United States was 14,170, the number in the same quarter of 1860 having been 21,104, and in that of the following year 6348. Of the 12,866 English who emigrated about 5,255 went to the United States, and 6536 to the Australian colonies.

Prices, the Weather, and Pauperism.—The average price of consols was 93¼; it has been above 93 in the four quarters that have elapsed since September of last year. Wheat (the average price 56*s.* 10*d.* per quarter) was dearer than in the same period of last year, when the price was 52*s.* 1*d.* The average of the highest and lowest prices of beef at Leadenhall and Newgate was 5¼*d.* per lb.; and of mutton 6⅛*d.* Best potatoes were 115*s.* per ton; they were dearer than they had been at the same time last year.

The mean temperature of the air at Greenwich was 58°·7, which is 1°·3 below the average of the same three months in twenty-one years. The coldness of the season would have ranged still higher in meteorological notation, but that warmer weather in the latter half of September modified the final result. Mr. Glaisher writes that "the cold weather which set "in on the 9th June continued with trifling exceptions till the 12th "September. Within this long period of ninety-six days there were only "twelve days on which the temperature reached or exceeded its average "value." During the last eighteen days of September the weather was warm. The mean temperature of July was lower than that of the same month in any year since 1841 with the exception of 1860. The mean temperature of August was lower than that of the same month in any year since 1845, with the exception of 1860. The mean temperature of September was nearly one degree above the average. The atmosphere was humid throughout the summer. The fall of rain was 6·3 inches, the half of which was in August; but though the last-mentioned month was wet, the total fall in the quarter was not excessive.

Much rain fell in the northern counties; as much as six inches in August at Alnwick and North Shields. At Manchester the fall in the three months was almost 12 inches. In some of the reports of registrars in Lancashire the weather is stated to have been mild, and conducive to health.

The returns of the Poor Law Commissioners are heavy for the summer quarter. The increase of pauperism is seen in the following statement, which shows the quarterly average of poor persons relieved on the last day of each week:

	Indoor.	Outdoor.
Quarter ending 30th Sept. 1860	101,680	667,680
" " 1861	112,930	693,631
" " 1862	119,600	789,917

Deaths, and the State of the Public Health.—The total number of deaths in the three months that ended 30th September was 92,381. In the same quarter of 1860 it did not much exceed 86,000; in that of 1861 it was 101,232. The cold summer of this year was less healthy than the still colder summer of 1860; but it was healthier than the warmer summer of last year. A cold winter makes frequent funerals; it cuts off quickly the old and infirm; but it may be admitted amongst ascertained facts that a cold summer with rain enough to wash and sweeten the earth and air is favourable to health, and especially to the health of children. The weather which the farmer most desires for his harvest operations is not the most salubrious for the people who are to be afterwards fed with his produce. It is the business of sanitary science to assist in reconciling these separate interests.

The annual rate of mortality in the quarter was 1·800 per cent. of the population against an average derived from ten summers (1852–61) of 2·02 per cent. In these ten summers there is but a single example of so low a death-rate, viz., that furnished by 1860, which was 1·718. Even in summer which is the healthiest season of the year the mortality of all England is seldom so low as 1·90 per cent.

But the country districts apart from the towns testify as usual to the benefit which they derive from "country air," for their rate of mortality was 1·572 (the average being 1·719); whilst in urban populations it was 1·984 (the average being 2·295). The causes, meteorological or of whatever kind they may have been, which exerted a wholesome influence on the population generally, saved in the country districts in every ten thousand persons 15 lives, which would have been lost in a season when the mortality was near its average; and in the towns the saving was double that amount, namely of 31 lives in an equal number (10,000) of the population. The remark is obvious enough, but it may be excused

because it is in accordance with the facts stated, that if there is dirt to be removed by water, or miasms to be checked by cold, the part where such nuisances most abound will be most benefited by the destruction or removal of them.

Though the rate of mortality of town districts in the aggregate was 1·98 per cent., in many towns it was much higher. To take a few instances: in London it was 2·09; in Liverpool 3·12; in Manchester 2·40; in Sheffield 2·47; in Leeds 2·75; and in Rotherham 2·76.

Two of the registrars of Rotherham report that there is a great increase of the deaths in that district in consequence of an outbreak of typhoid fever ascribed by the medical officer of health, Dr. Shearman, to the scantiness of the water supply, which is not sufficient for the effective working of the drains. Of 143 deaths in Kimberworth, a sub-district of Rotherham, no less a number than 66 was from typhoid fever. The two sub-districts, Rotherham and Kimberworth, suffered a mortality in the quarter equal to 3·22 per cent. per annum.

The mortality of the North-western counties (Lancashire and Cheshire), which is always high, was last quarter not quite so high as that of London, and it was not much higher than that of Yorkshire. In the last-mentioned division the death-rate was 1·97 per cent.; in Lancashire and Cheshire 2·02; in London 2·13. The Northern counties (Northumberland, Durham, &c.) show a rate of mortality in the quarter of 1·84. These four divisions are distinguished from the remaining seven divisions by the higher death-rates that prevailed in them. In the South-western counties (Cornwall, Somersetshire, &c.) the population enjoyed the greatest health, for the death-rate did not exceed 1·54; and in the South-eastern (Surrey, Kent, Sussex, &c.) it was almost equally low. The following districts in the North-western counties exhibited a continuous increase in the number of deaths in three September quarters:—

	1860.	1861.	1862.
Northwich	144	155	192
Great Boughton	225	261	299
Wirral and Birkenhead	281	337	397
Liverpool	1,680	2,037	2,115
West Derby	923	1,227	1,321
Clitheroe	68	85	100
Chorley	147	191	207
Ulverston	137	149	177

The excess in Liverpool was caused by diarrhœa and scarlatina; and it cannot be doubted that if those and other diseases of children, or fever, broke out in the more distressed districts where families who had lived apart now crowd in the same house, the mortality would be great. The following are certain of the districts where there has been a decrease of deaths in the last September quarter:—

	1860.	1861.	1862.
Wigan	452	496	432
Bolton	624	836	572
Bury	461	556	453
Chorlton	716	1,000	880
Manchester	1,553	1,968	1,475
Ashton	638	817	636
Oldham	542	666	601
Rochdale	431	481	353
Haslingden	341	387	296
Burnley	339	448	326
Blackburn	562	687	526
Preston	549	731	603

A few of the registrars witnessing a reduction of the mortality with the distress that prevailed in their districts at the same time have been

tempted to speculate on the facts, and as those officers in the course of their duties are in frequent communication with the labouring classes their opinions may be quoted. The registrar of Wigan states that more freedom to breathe the fresh air, inability to indulge in spirituous liquors, and better nursing of children, are believed to have improved the public health. The registrar of Little Bolton holds that the decrease of deaths is mainly due to a greater amount of domestic superintendence. The registrar of Hulme thinks that the even temperature of the weather and increased attention paid to young children have caused the decrease. The registrar of Knott Lanes (Ashton) attributes the result to absence of epidemics, mildness of the weather, out-door exercise, maternal care; also to parish relief and charitable contributions, by means of which food has been obtained not sufficient for health but enough to mitigate distress and prevent hitherto an increase of mortality. The registrar of Preston sub-district also refers to the good effect of fresh air, nursing, and mildness of the weather, and he adds: "In the weeks ending August "2d, 9th, 16th, 23d, and 30th, I registered 30, 25, 29, 24, and 37 deaths, "but in the corresponding weeks of 1861 when work was more plentiful "and people in better circumstances they were 50, 40, 50, 42, and 57. "The peaceful and dignified conduct of the operatives entitles them to the "warmest sympathy and support of all classes." The registrar of Ancoats (Manchester) is convinced that the low rate of mortality in his sub-district was due to the coldness of the summer, in consequence of which diarrhœa did not prevail.

It has been recently asked whether starvation is good for the health, and attempts have been made with indifferent success to solve a difficulty which has not arisen. Nobody will seriously contend that inadequate supplies of food are conducive to health; it is too well known that famine has often slain its thousands; but it is right at the present time to guard against deductions from the returns of mortality which they do not justify. It has been assumed as obvious that if the death-rate in the distressed districts does not exceed or falls below that which has prevailed in times of prosperity, the relief obtained by the unemployed from public and private sources has sufficed to maintain them in health. The allowances may or may not have been sufficient in amount, but the returns of mortality furnish no evidence of the fact; they only show that extreme consequences of famine have not yet been manifested. Recreation in the open air, moderation in meat and drink, and the due administration of domestic offices are beneficial to health, but if they have been compensation for the loss of wages the tables above quoted are silent on the point. These tables prove that under circumstances favourable to human life the mortality in England was reduced last quarter, and that the districts of the cotton manufacture were not prevented by the distress from participating in the benefit; they cannot show that if Lancashire had been prosperous the health of its people would not have been still better and a further reduction of mortality obtained. It is a matter not of speculation but fact that winter approaches, and that the cold of winter swells the bills of mortality by attacking the old, the young, and the infirm of middle age, and it needs not the gift of prophecy to predict that if cold and want, prolonged and embittered, attack a population with combined force, it must fall as if under an armed host. To avert or mitigate such a result, food, clothing, bedding, and firing must be dispensed by a public or private charity that can rise to the greatness of the occasion.

The registrar of Corby (Bourn) in Lincolnshire writes as follows:—

An epidemic of typhus broke out in Corby about three weeks ago, almost simultaneously in all parts of the village. In a few days there were under medical treatment about 40 cases, more or less severe, in a population of rather more than 800. Though there are some severe cases, there has been no death as yet; neither has the epidemic, so far as I am aware, spread into the surrounding parishes. The place, however, is shunned. Corby has, until the last few years, been considered healthy. In 1858 there

were some deaths from fever; in 1859 diphtheria broke out, and 10 deaths from it were registered, in Corby, in a few weeks. Since that time fever appeared to linger in the place, a death from that cause now and then occurred till the present visitation, which may be considered general, for about half the houses in the village contain sufferers from the epidemic.

Smallpox was very prevalent in Sunderland.

Fourth Quarter.—October, November, December, 1862.

In respect to marriages the general result is unfavourable; during the whole of two years, 1861–2, the marriage-rate has been low. The growth of the population did not suffer by failure of the natural supply, for births were numerous in the last three months, as they were during the whole of last year. But the deaths were also numerous. The rate of mortality was above the average; and apparently the principal cause of this excess was the cold weather of November, which carried off many persons in all parts of the country.

Marriages.—There were 48,624 marriages in the last quarter of 1862; a number nearly the same as that of the corresponding period in 1861, but less than in that of 1860 when it was 50,688. The circumstances that have operated to depress marriages in England have not prevented

The following are the names of the 139 Districts and 56 Sub-districts comprising the CHIEF TOWNS:—All the 37 Districts of London; Croydon, Kingston, Richmond, Gravesend, Medway, Tunbridge: *West and East Maidstone Sub-districts* (Maidstone); Canterbury; *Minster Sub-district* (Sheppey); Thanet, Dover, Hastings, Brighton; *Shoreham Sub-district* (Steyning); Portsea Island, Alverstoke, Southampton; *Winchester Sub-district* (Winchester); Reading, Brentford, Edmonton; *St. Clement Sub-district* (Headington); Oxford, Northampton; *Peterborough Sub-district* (Peterborough); *Bedford and Kempston, and Bedford and Cardington Sub-districts* (Bedford); *Luton Sub-district* (Luton); Cambridge, West Ham, Colchester, Bury St. Edmunds, Ipswich, Yarmouth, Norwich, King's Lynn, Melksham, Salisbury; *Weymouth Sub-district* (Weymouth); Exeter; *Torquay Sub-district* (Newton Abbott); Plymouth, East Stonehouse, Stoke Damerel, Truro Redruth; *St. Mary Magdalen and St James Sub-districts* (Taunton); *Bridgwater Sub-district* (Bridgwater); Bath; *Bedminster Sub-district* (Bedminster); Bristol, Clifton; *St. Nicholas and St. John Baptist Sub-districts* (Gloucester); Cheltenham; *Hereford City Sub-district* (Hereford); Madeley, Shrewsbury; *Stafford Sub-district* (Stafford); *Newcastle-under-Lyme Sub-district* (Newcastle under-Lyme); Wolstanton, Stoke-upon-Trent; *Burton on-Trent Sub-district* (Burton-on-Trent); Wolverhampton, Walsall, West Bromwich, Dudley, Stourbridge; *Kidderminster and Lower Mitton Sub-districts* (Kidderminster); Worcester, Birmingham, Aston, Coventry, Warwick; *Loughborough Sub-district* (Loughborough); Leicester; *Boston Sub-district* (Boston): *Lincoln Home Sub-district* (Lincoln): *Great Grimsby Sub district* (Caistor); Radford, Nottingham; *Newark Sub-district* (Newark); Derby, Hayfield, Stockport; *East and West Macclesfield and Sutton Sub-districts* (Macclesfield); *Runcorn Sub-district* (Runcorn); *Congleton Sub-district* (Congleton); *Chester Castle and Chester Cathedral Sub-districts* (Great Boughton); Birkenhead, Liverpool, West Derby, Prescot, Wigan, Warrington, Leigh, Bolton, Bury, Barton-upon-Irwell, Chorlton, Salford, Manchester, Ashton, Oldham, Rochdale, Haslingden, Burnley, Blackburn; *Chorley Sub-district* (Chorley); Preston; *Lancaster Sub district* (Lancaster); Keighley, Todmorden, Huddersfield, Halifax, Bradford, Hunslet, Leeds, Dewsbury, Wakefield, Barnsley, Ecclesall Bierlow, Sheffield; *Doncaster Sub-district* (Doncaster); *Bootham, Micklegate, and Walmgate Sub-districts* (York), Sculcoates, Hull; *Scarborough Sub district* (Scarborough): *Darlington Sub-district* (Darlington); Stockton, Hartlepool; *St. Oswald and St. Nicholas Sub districts* (Durham); Houghton-le-Spring, Sunderland, South Shields, Gateshead, Newcastle-upon-Tyne, Tynemouth; *St Cuthbert and St. Mary Sub-districts* (Carlisle); *Whitehaven Sub-district* (Whitehaven); *Kendal Sub district* (Kendal); *Newport Sub district* (Newport); *Cardiff Sub-district* (Cardiff); Merthyr Tydfil; *Llangafelach and Swansea Sub-districts* (Swansea); *Llanelly Sub-district* (Llanelly); *Pembroke Sub-district* (Pembroke).

Note.—The three months January, February, March, contain 90, in leap year 91 days; the three months April, May, June, 91 days; each of the last two quarters of the year, 92 days. For this inequality a correction has been made in the calculations, also for the difference between 365 and 365·25 days, and 366 and 365·25 days in leap year.

an increase of them in certain parts. In the three March quarters of 1860–2 the marriages in London were respectively 7265, 7333, and 7811. A few districts in the South-eastern Division that furnish examples of increase may be noted, viz., Thanet, Faversham, Eastbourne, Hailsham, Ticehurst, Uckfield, East Grinstead. There is in England as much diversity in the social condition of the populations of different localities as in the nature of their respective soils; they have their various times and opportunities to win and to lose; to marry and abstain from marriage. Circumstances of an exceptional character are also constantly at work to

cause fluctuations in the marriage lists; as, for example, the attraction of labourers to a spot for the construction of a new line of railway, or the partial interruption of operations in an iron mine.

In five of the Eleven Divisions an increase of marriages is found in comparing those of the December quarter of 1862 with the mean of the two previous corresponding quarters. Those five Divisions are London, North Midland Counties, Wales, South-eastern Counties, and Northern Counties. The increase in the Northern Counties is hardly appreciable. In the remaining six Divisions there is a decrease which varies from about one per cent. in the South Midland and Eastern Counties to 4 and 5 per cent. in the West Midland Counties and Yorkshire, and to no less than 15 per cent. in the North-western Division, in which the cotton manufacturing industry has been so long in a state of prostration.

Lancashire, exclusive of Ulverston, consists of twenty-five districts; and in fifteen of them there was a decrease of marriages in each of the December quarters of the last two years. The numbers in these districts were—

In Cheshire the marriages in the district of Stockport were 332; 218; and 198 in the three corresponding quarters.

In Blackburn the decrease of marriages in the quarter on those of two previous December quarters was equal to 48 per cent.; in the more extensive but less populous district of Chorley, the decrease exceeded that high proportion, and reached 59 per cent. In Burnley it was 39 per cent.; in Chorlton, Bury, Preston, about 36 per cent.; in Wigan and Leigh 33 per cent.; in Stockport 28 per cent.; in Bolton and Oldham 25 per cent.; in Ashton and Haslingden 23 per cent.; in Manchester it was only 14 per cent.

The annual marriage-rate in England (persons married to the population) in the quarter was 1·890 per cent. against an average (in the 10 December quarters 1852–61) of 1·99. In London it was 2·15; and in Lancashire it was 1·70 per cent.

Births.—The total number of children born in the autumn, *i.e.* the fourth quarter, was 172,431. In autumn the birth-rate is invariably lower than in either of the first two quarters; and it is generally lower than in the September quarter. But, whatever may be the fluctuations in the birth-rate if season with season, or year with year, is compared, the rule holds, not without deviation, but with tolerable constancy, that more children are enrolled in the birth-registers in any year than have been entered in that which preceded it; and the births in 1862 exceeded by 88,672 the number in 1852. The birth registration of last year, extending over a period of 52 weeks, was as great as it was ten years ago, in fifty-nine or sixty weeks.

In last quarter the annual birth-rate was 3·350 to a hundred of the population. It was higher than the average, which is 3·23. In London 24,480 children were born; in the North-western Counties, Cheshire and Lancashire, the number was 26,419. The metropolis had a population in 1861 in round numbers of 2,804,000; the manufacturing division had 2,936,000.

The birth-rate in Cheshire and Lancashire was 3·481 per cent.; it was higher than the birth-rate in England (3·350). In London the rate was 3·370, and therefore lower than the rate that prevailed in the entire English population. It rose as high as 3·552 in Yorkshire, 3·633 in the Northern Counties (Durham, Northumberland, Cumberland, and Westmorland); and it fell as low as 3·090 in the Welsh Division. The most prolific population is found in the coal-producing districts of the North, and the thriving ports on the Tyne and the Wear.

Increase of Population.—The births in the quarter exceeded the deaths in the same period by 57,657. Part of the accumulation is constantly

lost in the stream of emigrants. In the three months 25,284 emigrants left ports in the United Kingdom at which there are Government Emigration Officers; and of these about ten thousand were of English origin. In the last three months of 1861 the total number of emigrants was only 16,559.

The whole emigration of 1862 consisted of 121,214 persons, English, Scotch, Irish, and Foreign, of whom 58,706 left the shores of the United Kingdom for the United States, 15,522 for the North American Colonies, 41,843 for the Australian Colonies, 5143 for other places. England contributed more than a third part of the total number of emigrants. About 60,000 persons of Irish origin left in the year; and more than half of these went to the United States. The Scotch preferred Australasia.

Of married men there were 10,725; of married women 12,854; of the unmarried above 12 years of age there were 39,563 males, 24,240 females.

Prices, the Weather, and Pauperism.—The price of wheat fell. The average price in the last quarter of the year was 48*s.* 2*d.* per quarter, which is less by 8*s.* 7*d.* than in the corresponding period of 1860, and less by 11*s.* 1*d.* than in that of 1861. The average price of the best potatoes was five pounds per ton, which is less by a pound than it was in the last quarter of the two previous years. The cheapness of this favourite and anti-scorbutic esculent was a fortunate circumstance for the workmen of Lancashire in the ruin of their trade.

Mr. Glaisher, in his Report on the Weather, states that the quarter began with a warm period that lasted seventeen days; after which the weather was variable, but for the most part rather cold till the end of the month. November commenced with a few warm days, which were followed by a cold period that set in on the 6th and continued to the 2d December, the mean temperature having been 4°·5 below the average. In the last twenty-nine days the air was as warm as it had previously been cold, the average excess having been 4°·5 daily.

The mean temperature of October was, with two exceptions, higher than it had been in the same month since 1847; that of November was lower than it had been in the same month since 1829, two Novembers excepted; and December was warmer than that month had been since 1843, with the exception of three Decembers in that period.

At Greenwich the fall of rain in the year was 26·5 in., and a fourth part of it was in the last quarter. Both these quantities are rather more than their respective averages. The rain-fall in 1862 varied from 20·4 in. at Scarborough to 54·4 in. at Stonyhurst.

The average numbers of paupers relieved on the last day of each week in the quarter were :—

	In-door.	Out-door.
Quarter ending 31st December 1860 -	115,161	673,721
" " 1861 -	128,533	716,096
" " 1862 -	132,663	907,514

If the last of the three periods is compared with the first, the recipients of parochial aid increased by 251,318.

Deaths; and the State of the Public Health.—The total number of deaths in the three months that ended 31st December was 114,774. In the corresponding season of 1860 it was nearly 103,000; in that of the following year nearly 105,000. Though the last of these autumns was not as a whole colder than those which preceded it, the sudden invasion of cold in November and the abrupt succession of heat account for its having been the most fatal. The death-rate was 2·230 per cent. against an average of 2·17. In the principal towns the rate of mortality in the quarter would have carried off 253 persons in a year out of a population of ten thousand (against an average of 245); and in the small towns and country parishes it would have carried off 186 out of a population of equal amount (against an average of 187).

The North-western Counties, Yorkshire, London, the Northern Counties, the West Midland, are five divisions in which the highest rate of mortality prevailed. In the first, which contains the districts of the cotton manufacture, the rate (2·66 per cent.) was higher than in any other division. This distinction is not of recent birth; it is not the fruit of adverse circumstances, but has sprung from causes which have been in operation since Liverpool, Manchester, and other towns in what has been called the worst drained part of England rose into importance as seats of commerce and manufacture. But whatever be the sanitary condition of the towns and villages they inhabit, human beings must be affected by the atmosphere in which they are immersed, and the effects of which they can but partially control; and as the cotton districts participated with the rest of the kingdom in the benefit of a healthy summer, they have also suffered, like other parts, from a less healthy autumn. The mortality rose from 2·46 per cent., the mean rate of the two previous autumns, to 2·66 per cent., but in London it also rose from 2·25 to 2·49. Further, the mortality did not increase quite so much in Lancashire and Cheshire as it did in Yorkshire.

The registrar of Preston sub-district reports that typhus became prevalent there in the early part of October; it excited the most serious apprehensions, and, notwithstanding the greatest efforts to check its pro-

* Approximated to the results of Robinson's Anemometer by reductions from Whewell's.

gress, 48 cases proved fatal. Dr. Buchanan in his report pronounced it to be of the Irish type, "the steady follower on famine;" he found a decline from the normal standard of health among the unemployed operatives of the cotton towns, and that scurvy and other symptoms of a hæmorrhagic tendency had been manifested. On the other hand, the report of the Central Executive Committee (for the relief of distress), dated 19th January, states that the middle of winter had been gained without the outbreak of any serious epidemic, or the appearance of scurvy, diarrhœa, or dysentery, forms of disease that follow prolonged low diet, and the use of coarse food without much variety. The registrar of Chorlton-upon-Medlock writes that notwithstanding the great number of persons unemployed, no epidemic has prevailed, nor any disease resulting from privation; that the poor are provided for liberally and with "wise economy." Scarlatina and diphtheria, and also diarrhœa, prevailed to a considerable extent in Manchester. An increase of deaths in Ashton-under-Lyne is attributed to scarlatina and measles. Scarlatina caused eighty deaths, being a third part of the total number, in Oldham-above-Town; these occurred not only in the working class but in the general population. In Blackburn and in Witton, which is also in the Blackburn district, the mortality was increased by measles and bronchitis; and at the latter place there was "much sickness in consequence of the damp weather." The mortality in the Chorley sub-district was nearly doubled, chiefly by measles; and the weather, "mild and damp," was considered unfavourable to health.

It will tend to strengthen the conclusion that the increase of mortality in Lancashire in the last quarter was not caused directly by famine, nor indirectly by diseases induced or aggravated by it, if it be stated, in addition to facts that have been mentioned above, that of the twenty-six districts of which that county is composed, while a certain number exhibited an increase of deaths over those of the corresponding quarter in 1861, there was in an equal number of districts an actual decrease. The districts of Bolton, Manchester, Salford, Burnley, and Preston are amongst those that stand in the latter more favourable category. The munificence of the nation, aided by its kinsfolk in other lands who "have brought their food from afar," has hitherto averted the last, direst extremity, the death of a people by famine. Amongst elements of the situation that have been conducive to health, are the cheapness of provisions, a winter in great part unusually mild, increase of maternal care, recreation out of doors, and perhaps, for many men and women who were not robust, a season of needful rest. The future of "the cotton-famine" is still undetermined,—in the language of the Central Executive Com-

mittee it may be even "full of gloom and uncertainty," and "to chill the sympathy or arrest the efforts" that have been evoked, would be rash,—but that which is past may be subject of congratulation; and it is now known that the history of the distress is not written in the death-registers of the year that has closed.

The registrar of Preston sub-district wrote at the end of the quarter, as follows:—

There are 42,331 persons, exclusive of 883 in the workhouse, now receiving relief, or more than one half of the whole population entirely dependent upon the Board of Guardians and the Relief Committee for support. It is gratifying that in the midst of so much poverty there has been a decrease of crime to the extent of one-sixth; and the mayor stated, that on Tuesday, December 9th, there was not a police case for adjudication, a circumstance that had not occurred for many years before.

The deaths in the district of Liverpool rose from 1883 and 2184, the numbers in the corresponding quarters of 1860–1, to 2621 last quarter; those in West Derby rose from 1111 and 1472 to 1728. A great part of this formidable increase has been caused by the ravages of scarlatina. This disease caused 50 out of 105 deaths in the Clowance sub-district in Devonshire. Of 203 deaths in Kingston (Portsea Island) no less than 126 were those of children from scarlatina or other fever, and croup. A very malignant form of scarlatina raised the deaths much above the average at Halstead in Essex; and it is reported in many other parts. Diphtheria caused a third part of the mortality at Hailsham in Sussex; and it is stated that it has been very prevalent in South Walsham in Norfolk, where, out of 34 deaths from all causes, 13 were from this disease, and 9 of these occurred in the parish of Beighton. Diphtheria was very prevalent in Diss, Norfolk, and trebled the average mortality in the parish of Dickleburgh. Measles has been unusually rife and fatal in Falmouth; hardly a family with children escaped, and many adults were attacked by it.

The registrar of Monkwearmouth, Sunderland, writes:—

Births are 233; Deaths 165. The deaths are very much above the average. Scarlatina prevails in my sub-district to an alarming extent, and 44 cases have proved fatal. In my opinion the increase of epidemic diseases is partly accounted for by sanitary measures not being thoroughly carried out in back streets, alleys, and courts, where there are many nuisances. Dock-street, Victor-street, Barrington-street, Hardwick-street, Bloomfield-street, Topliffs-row, and Wilson-street, where many of the deaths have occurred, and many children are still lying ill of small-pox and fever, should be specially mentioned.

Health of London in 1862.

The average birth-rate in London is 3·383 per cent.; or in every thousand of a population, which in a short time will have completed its third million, nearly 34 children are born annually. Partly by an excess

of births over deaths, which has been maintained above 30,000 in each of the last four years, and partly by immigration from the provinces and more distant parts, the London population has made such progress that its births in 1862 exceeded by nearly seventeen thousand its births in 1852. In 1863 or 1864 100,000 children will probably be born in London. It may be stated in approximative numbers that each of its three millions of inhabitants will produce annually 34,000 children.

Last year 97,850 children were born, of whom 49,382 were boys, and 48,468 were girls. The proportion was nearly 102 males to 100 females. In 1860 the proportion was 104; in 1861 it was 103 males to 100 females. But this due proportion of the sexes at birth is reversed in the actual constitution of the population, in which females preponderate. In the middle of last year the male population is estimated to have been 1,333,781; the female population 1,525,953; the total 2,859,734. The metropolis attracts young women to its families and its shops,—to millinery and other female occupations in which it abounds. Young men are tempted by more active fields of enterprise to seek their fortunes abroad. A higher standard of life has given numerical preponderance to the female element of the population, in England as well as in London.

The following Table exhibits the numbers of males and females at different ages in London, as found on 8th April 1861 :—

All Ages.	Under 5 Years.	5–	10–	15–	20–	25–	30–	35–	40–	45–	50–	55–	60–	65–	70–	75–	80–	85–	90–	95 and upwards.

In England the proportion of Females in the population to Males is nearly as 105 to 100. In London it is as 114 to 100. The excess of Females is apparent in each quinquennium.

Not only the births of males are in excess of those of females, but also the deaths of males almost invariably exceed those of females, and in last year the proportion in London was 104 deaths of males to 100 females, which is nearly the average proportion in England. Maitland, who published his History of London in 1739, speculated on this twofold result, which he was enabled to deduce from the christenings and burials of the seventeenth and eighteenth centuries; and he drew the conclusion, which undoubtedly was erroneous in those times, as it would be in the present day, that the population within the bills of mortality contained a

* See note (*) on page 83.

majority of males. He writes: "Having the bills of mortality now "before me, I think it will not be amiss to undeceive the public in these "particulars: 1. Much the greatest part of mankind are of opinion that "there are two females to one male of the human species; but that this "is a palpable error is manifest from the accounts of christenings and "burials from the year 1657 to that of 1738, during which time of "eighty years there appears to have been christened 619,187 males and "585,334 females, and buried 994,656 males and 965,298 females, which "in the christenings amount to 33,853 more males than females, which "is 5½ per cent. in favour of the former, and in the burials, 29,358, which "is likewise 3 per cent. in favour of the males. This is a double de-"monstration that there are considerably more males than females." He adds, that "the majority in favour of the males is by our naturalists "said to be designed by nature for the support of that part of the human "species which is more liable to be destroyed by war than the other. "But as war is only casual, and not perpetual, I am of opinion that "this supernumerary supply is designed by nature as a constant remedy "against incessant contingencies which the males are more obnoxious to "both by land and water than the females." The second prevailing opinion which he undertakes to refute is, that "not one person in a "thousand lives to the age of seventy or eighty."

Births in England are more numerous in the six months, January—June, than in the six months, July—December; and on an average of years the birth-rate falls with the four quarters, for it is highest in the March quarter, next highest in the following quarter, till the December quarter, when it is lowest. In 1862, the greatest number of births in London in any of the fifty-two weeks was registered in the sixth week, when it rose to 2197. The number of births, which with one exception was the lowest, was returned in the thirty-third week ending 16th August, and was 1648. Only 1610 births were returned in the fifty-second, or last week of the year; but as it included Christmas-day, which is lost in a great measure to registration, the return is not justly admissible in the present comparison. Births which had occurred before the end of the fifty-second week, and which for the reason that has been stated were

* For the years 1849-59 the results are only approximative, having been reduced to Robinson's Anemometer from observations made with Whewell's.

† By Robinson's Anemometer, adopted in place of Whewell's, which was used formerly.

not registered in that week, contributed to swell the return of the first week of 1863, when the number rose to 2146.

The greatest number of deaths occurred in the forty-eighth week, ending 29th November, when they rose to 1745. In that week the mean temperature of the air fell to 37·1°, and the dryness of the atmosphere was only 2·9°. The least number of deaths occurred in the twenty-eighth week, and was 1065, when the mean temperature of the air rose to 58·2°, and the dryness was 5·1°. The mean dryness of the atmosphere (the difference between the mean dew-point temperature and air temperature) was as high as 10·6° in the thirty-first week, and as low as 1·1° in the forty-fifth. Nearly two inches of rain fell in the twelfth week, and nearly as much in the fifteenth, nineteenth, thirty-fourth, and forty-second week. In three weeks no rain was measured, and in eight others the quantity was little more than appreciable. It fell on 177 days. The whole amount of rain in the year was 26 inches, which is 2 inches above the average. This quantity was distributed in tolerably equal proportions over the four quarters.

The lowest night temperature of the air was 20·4°, and occurred on 19th January. The highest day temperature was 81·5°, on 6th May. In eight out of the twelve months the mean temperature was above the average.

The year to which the present "Summary of Weekly Returns" relates is the tercentenary of bills of mortality in London. It is interesting to know that those records made their first appearance three hundred years ago, and for the year 1562, though it seems that they were not published weekly at that early period but only as a summary at the end of the year. The following is an extract from the writer who has been quoted above: "As neither the parish clerks' account or that published by Mr. Graunt "take any notice of the first bill of mortality published in this city for "the year 1562, nor of those for the years 1593 and and 1603, I shall "supply those defects from the great and valuable library of Sir Hans "Sloane, Bart., which by the vast number of its books and generosity of "its owner is rendered as useful as any of the public libraries within the "city or suburbs of London. In the year 1562 a grievous pestilence "raged in this city; therefore, in order to know the increase and decrease "of the same, it was judged necessary to take an account of the number "of burials, which being the first of the kind that ever was taken in "London, it commenced on the 1st January 1562 and ended the last of "December, whereby it appears that the number total buried within the "city and suburbs in that year amounted to 23,630, whereof of the "plague 20,136."

In 1562 the plague caused 85 per cent. of the total number of deaths; in 1849 cholera and diarrhœa caused 26 per cent., and in 1854 they caused 19 per cent. of the total number.

Last year the deaths from all causes were 67,371, of which 34,288 were those of males; 33,083 were those of females. The rate of mortality was 2·356 per cent. In the North districts the rate was 2·200, in the West 2·230, in the South 2·268, in the Central 2·583, and in the East districts the highest rate of mortality prevailed, namely, 2·598 per cent. The South districts have achieved for themselves a marked improvement.

GREAT BRITAIN.

The estimated population of Great Britain in the year 1862 was 23,416,117, and the marriage-rate was 1·576 per cent., the birth-rate 3·501, and the death-rate 2·151. The marriage-rate of Scotland is below that of England; thus in a population of 100,000 in England,

1614 persons married in the year; while in Scotland 1334 married out of the same population. The Registrar General of Scotland does not appear to consider that this reduced proportion is entirely due to defective registration.

It is a remarkable fact that the registration of marriages is compulsory in England, and is not compulsory in Scotland as regards irregular marriages; while the registration of births is compulsory in Scotland, but is not compulsory in England. The registration is so important to the children in both cases, that it should be at once enforced by penalties in all the divisions of the kingdom.

TABLE XXX.—Estimated **Population, Marriages, Births,** and **Deaths** in **Great Britain,** in the Year **1862.**

* The returns for France in the year 1862 include the three newly annexed departments.

† The returns for Austria exclude Hungary, Kroatia, Slavonia, and Transylvania: but the proportions per cent. are estimated to represent the rates prevailing in the entire empire.

I have for some years been able, through the courtesy of M. Legoyt, to give the returns for France in conjunction with those of England. This year Dr. Ficker, the head of the Statistical Department at Vienna, has supplied me with similar returns for the Austrian Empire; and thus we have the means of comparing the progress of marriage, birth, and death among nearly a hundred millions of people.

The government of the King of Italy has displayed great activity in the field of statistics, and has just published a report on the statistics of the kingdom during the year 1862, from which Table XXXIV. has been derived.

Including the three newly annexed departments, France had 37,532,883 inhabitants in 1862; the marriage-rate was 1·592, the birth-rate 2·626, and the death-rate 2·138 per cent. on the population, including the army.

The death-rate of France agrees closely with that of Great Britain, and is rather below it; but the mortality there fluctuates largely, and the average rate is above that of England. The birth-rate of France is

2·626, of England 3·504 per cent.; the marriage-rate being little lower in France than it is in England.

The marriage-rate of Austria is 1·826, the birth-rate 3·945, and the death-rate 3·020. Austria is evidently advancing rapidly, and the increase of marriages implies the increasing prosperity of the Empire which stands on the Carpathians, the Alps, and the Danube. The measures tried successfully in England will diminish the high mortality there, which is referable to causes evident to all travellers in Germany, and which has attracted the attention of Dr. Helm, Dr. Haller, Dr. Glatter, and other patriotic Austrian physicians. In the meantime Dr. Ficker's Tables exhibit in a trustworthy form an immense series of facts of universal interest.

	Total	1,811	1,128	2,939

* British subjects are not particularly described upon Schedule C., but foreign names have been excluded from this account.

† The deaths of soldiers, marines, and invalided seamen from the Royal Navy were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, and 122 in 1862. The number is 831 in seven years, which, if added to the 2939 above, makes 3491, the total number of deaths of British subjects at sea in 1856-62, exclusive of those of merchant seamen.

Empire greater than that of any army in Europe, is now approaching the normal state. The deaths per 1000 of the non-commissioned officers and

TABLE XLIII.—**Mortality** of **Merchant Seamen at Sea,** in the 11 Years **1852–62.***

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Seamen. This return does not include seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals to which such men are sent; accounts of their effects are sent direct to the Board of Trade.

If a seaman dies on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel is not to return direct to the United Kingdom. But if a *passenger* dies on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred.

A column headed *Place of Birth* was formerly contained in the schedule, for the purpose of distinguishing passengers as British subjects or Foreigners, but in many cases it was not filled up by masters, in consequence of their inability to obtain the information after the death had taken place. A column headed "Whether "supposed to be a British subject or Foreigner" might be attempted. British and Foreign *seamen* are distinguished.

When a ship is lost with all persons on board, the owners return the number and names of the crew, but not of the passengers, to the Registrar-General of Seamen.

TABLE XLIV.—**Aggregate Number of Names on the Registers** at the End of each Year **1837–62**; also the **Number of Searches for Registers** at the **Central Office** (exclusive of Searches in Non-parochial Registers).

1862 – –	7,414,682	14,992,256	10,041,923	32,448,861	7,297

NOTE.—The numbers registered in 1837 are for the Half Year ending December 31st.

men during the five years 1858–62,—the first that of the war with China,—were 67, 34, 26, 26, and 20. Still further reductions may be hoped for when the army in India is subject to judicious sanitary regulation, such as is now in contemplation. The mortality of the officers in the same period was in the five successive years 35, 21, 16, 16, and 13 per 1000.

Mortality of Merchant Seamen at Sea.

In the year, 294 births and only 369 deaths of British subjects at sea were reported at this office for entry in the Marine Register.

The Merchant Seamen in the year 1862 were 173,863 in number, out of whom 3620 deaths were recorded by the Registrar General of Merchant Seamen. The mortality among them was at the rate of 2·08 per cent., or nearly 21 in 1000. This return does not include seamen dying ashore, at home, or in foreign parts. Something may be done to reduce this high rate of mortality, affecting an important class of men.

Progress of Registration.

The number of searches for entries in the registers of births, of deaths, or of marriages, at the Central Office, was 7297 in the year 1862; but these numbers bear a small proportion to the number of searches in the books of which the Superintendent Registrars and Registrars have the custody. The utility of the records is every day increasing.

Certified Places of Religious Worship.

The number of buildings certified as places of meeting for religious worship, and recorded in this Office under the Act of 18 & 19 Vict. c. 81., during 1862 was 704. At the close of the year the total number of such buildings on the register was 15,354, including 517 belonging to the Roman Catholics, 1910 to the Independents, 1546 to the Baptists, 9285 to the various denominations of Wesleyan Methodists, and 752 to the Calvinistic Methodists.

For an account of the Causes of Death in 1862, I beg to refer you to a letter addressed to me by Dr. Farr, which will be found in the Appendix.

I have the honour to be,
Sir,
Your faithful servant,
GEORGE GRAHAM,
Registrar-General.

ANNUAL ABSTRACTS

OF

BIRTHS, DEATHS, AND MARRIAGES.

1862.

ABSTRACT OF MARRIAGES.—Marriages registered in England, pursuant to the

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1862.

† Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions: in these cases the two ceremonies are entered as two marriages. This column also includes 29 cases of divorce, viz., 15 *men divorced* who married spinsters, 2 *men divorced* who married widows, 9 bachelors who married *women divorced*, 2 widowers who married *women divorced*, and in one case the parties, once husband and wife, but divorced, were re-married. For the districts in which these marriages took place see subsequent pages.

* Changes were made in the constitution of the Districts of Hunslet (500), Wakefield (503), Pontefract (504 *a*), and Tadcaster (514 *a*), and four new districts, viz., Kirkstall, Holbeck, Castleford, and Bramham, were formed therefrom during the year 1862. For particulars see "List of Changes," p. 172.

† In October and November 1862 two new districts, viz., Kirkstall and Holbeck, were formed out of the Hunslet district; but to avoid the inconvenience of disturbing the Tables they will be returned as heretofore in this year's Abstract. Of the 163 marriages entered for the December quarter in the Hunslet district 70 took place in the district of Kirkstall (population 60,831 in 1861), 25 in the Holbeck district (population 15,824 in 1861).

‡ Includes a man divorced who married a spinster.

* The *Registration Counties* consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

† Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1862—*continued.*

No.	REGISTRATION COUNTIES.	Area in Statute Acres.	Population, 1861.	Total Marriages.	Total Births.	Total Deaths.	Births. Including Illegitimate Births. Males.	Births. Including Illegitimate Births. Females.	Births. Illegitimate Births. Males.	Births. Illegitimate Births. Females.	Deaths. Males.	Deaths. Females.	Excess of Births over Deaths.

* The *Districts* are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 639 in number, are arranged according to their local position under the Registration Counties.

† For a table of the Deaths in the principal *Public Institutions* situated in the Districts of London *see* pages 83–4.

Note.—Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

NOTE.—The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose.

The letter *W* denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; *w* indicates that a Workhouse belonging to *another* District or Union is included.

Wherever the minus sign (−) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, *less than the Deaths* to the extent stated.

The Excess of *Deaths* over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see pp. 83-4.

I.—LONDON.—BIRTHS AND DEATHS, 1862—SUB-DISTRICTS—*continued.*

ENGLAND.—Supplementary Table of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all the Diseases, either having a distinct character, or fatal to any considerable number of persons, are classified under 114 heads; some of which, however, include groups of very distinct diseases,—such as are fatal to only a *few persons*, or *diseases* which are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers would not interfere with the calculated proportions. Where it is desired,

(*continued at page* 128.)

CAUSES of DEATH at different Periods of Life, in the Year 1862.

partial correction, however, can now be made by means of the following Supplementary Tables, containing many of the deaths from distinct diseases, such as mumps, epistaxis, piles, dry gangrene, polypus, rickets, bronchocele, &c. &c., and deaths from other forms of disease, such as softening of the brain (necrencephalus), which are returned in many cases under other heads, as paralysis, &c.

These Tables are an extension of the Tables of Causes of Death in England, pp. 120–125.]

Note.—In calculating the average annual rate of mortality from all causes in London, a correction has been made by distributing the deaths in hospitals proportionally over every district.

Population 1861, Average Annual Rate of Mortality from All Causes in the Ten Years 1851-60, and Deaths from several Causes in the Year 1862, in the Districts of England—*continued.*

II.—SOUTH EASTERN COUNTIES—*continued.*

	Districts.	Population, 1861.	Average Annual Rate of Mortality from All Causes to 1000 Persons living, 1851-60.	Deaths from several Causes in 1862. Small-pox.	Measles.	Scarlatina.	Diphtheria.	Whooping-cough.	Typhus.	Erysipelas.	Metria or Puerperal Fever.	Childbirth.	Influenza.	Dysentery.	Diarrhœa.	Cholera.	Phthisis or Consumption.	Diseases of Respiratory Organs.	Violence.

Letter to the Registrar General on the Causes of Death in England in 1862, by William Farr, Esq., M.D., F.R.S., D.C.L. 175–192

Letter to the Registrar General on the Causes of Death in England, by William Farr, Esq., M.D., F.R.S.

Year 1862.

Sir,

I have the honor to submit to you a brief commentary on the Tables of the Causes of Death in England and Wales.

In your Report it is shown that the mortality in the year was below the average; and upon referring to the disease tables we find that the deaths have increased under some heads, decreased under others, while the reduction arises from the balance turning upon the whole in favor of the year.

Scarlatina (scarlet fever), whooping-cough, and typhus, or typhia, in their various forms, are the prevailing epidemics of the year, and impress on it their zymotic character.

Of the 436,566 deaths the causes were specified in 429,000 instances; and of the 7,566 deaths left, the causes of 4788 were not specified at all, or were ill-defined, while 2778 were returned in vague terms, but were sudden, and gave generally occasion to inquests. The proportional number of the cases under these heads has decreased considerably within the ten years. 3187 were infants under one year of age; and 977 were old men and women of the age of 65 years and upwards, in whom also the symptoms of disease are often obscure. They demand on that account the strictest attention of the coroners.

Class I. Zymotic Diseases.

Fevers have hitherto been confounded together*; but many of the practitioners of the country can now distinguish the three forms, typhus, typhia, and typhinia, which Dr. Jenner and other writers have designated by the name of typhus, and of the descriptive, but not unobjectionable, names of typhoid fever and relapsing fever. All the continued fevers killed 18,721 people in England and Wales; they were, therefore, more fatal in 1862 than they had been in 1861 by 3281 deaths. Never disappearing they have killed 17,076 persons a year since the year 1850; and the annual mortality has ranged from 10·41 in 1852 to 6·63 deaths by fever in 10,000 inhabitants during the year 1860; since when these diseases have been growing more prevalent, and last year were fatal to 9·3 in 10,000.

Fevers strike down young men and women in the prime of life, and are, therefore, like consumption, the more deplorable in their results.

Table I.—**Ages** of the **Persons** who **Died** from **Fever** (**Typhus, Typhia,** and **Typhinia**) in the **Year 1862.**

—	All Ages.	0—	5—	10—	15—	20—	25—	35—	45—	55—	65—	75—	85 &upwds.
Persons -	18,721	3787	2232	1500	1676	1416	1928	1761	1511	1437	1026	400	47
Males -	9,370	1850	1061	655	739	714	986	945	839	797	549	214	21
Females -	9,351	1937	1171	845	937	702	942	816	672	640	477	180	26

* Dr. Murchison's treatise on continued fevers is the ablest monograph on any disease that has recently appeared in Europe; combining as it does masterly powers of exposition, learning reminding us of Haller, accurate observation, and great powers of analysis. If it were in the hands of every practitioner, all the forms of fever could not fail to be distinguished in the registers; and the great problem of fevers might be solved by the combined observations of all the best English observers.

Typhus and typhoid fever (*typhia*) belong to that class of zymotic diseases which attack men once as a general rule, so that those who survive enjoy afterwards a certain immunity; hence it follows that the attacks are much more numerous at the age (15—25) than at the age (25—35), because the susceptible population is proportionally greater at the first age than it is at the second.

The deaths at the ages 15—25 and 25—35 were 3092 and 1928. But it does not follow that the number of cases was in that proportion, as the mortality in these fevers varies at different ages.

Our statistics are at present imperfect, as they give no return of the total number of cases of fever of the various forms; but an approximation to the numbers can be obtained, and will serve to show, to some extent, the ravages of this devastating malady.

I annex a table of the mortality of all forms of fever at the London Fever Hospital at different ages; in which it will be seen that the mortality is at the rate of 9·67 deaths to 100 cases of persons of the age of 15—25, and 15·41 deaths to 100 cases of persons of the age 25—35. But in all England 3189 deaths by fever were returned of the first age, and 1898 of the second age; consequently if the mortality of cases of fever in the country at large is truly represented by that of the London Fever

---

TABLE II.—**Deaths** in **England** from **Typhus** in the Fifteen **Years 1848–62,** and **Annual Rate** of **Mortality** to 10,000 Persons living.

75 and upwards -	10	7	70·00
Age not stated - -	118	16	13·56

Note.—Under "Continued Fevers" are included Typhus, Enteric Fevers, Relapsing Fever, and Febricula; but all cases of "Fever" dependent on local disease are excluded.

Dr. Murchison shows the mortality of the three forms.

Hospital, the 3189 died out of 32,952 attacked, of ages 15—25, and 1898 died out of 12,317 persons attacked by fever of the ages 25—35. The same calculation is applicable to the deaths at other ages, and hence it may be inferred that at least 152,653 persons were attacked every year, and 17,491 died of these fevers.

In this great annual battle 17,491 Englishmen were killed, and 135,162 were severely wounded, but ultimately recovered.

The mortality of the severe fever hospital cases is probably twice as great as the mortality of cases out of hospital, so it is possible that as many as 150,000 slighter cases might be left out of this reckoning; which will more than counterbalance the cases of fever dependent on local disease, improperly returned as fevers, and classed under that head in our tables.

The fever itself subsides earlier; but the sickness which follows its complications protracts the duration of cases, which, on an average of the 152,653 cases, imply about a month's sickness in each; so the average fever

TABLE IV.—**Annual Number** of **Cases** (estimated) and of **Deaths** by **Fever** in **England** and **Wales** in the Fifteen **Years 1848-62.**

1857	19,016	9·97	46
1858	17,883	9·28	40
1859	15,877	8·14	36
1860	13,012	6·63	31
1861	15,440	7·76	36
1862	18,721	9·30	43
Mean - -	17,076	9·10	41

population during these years was 12.721. They would fill 127 hospitals, each containing a hundred beds, and require more than 4,643,000 days' subsistence.

About 56,784 cases and 8901 deaths occurred among men and women of the age of 15 and under 65; and in their illness 1,703,520 days of suffering were experienced, and 1,460,160 working days were lost.

Children and aged people are not often treated in fever hospitals, so that Dr. Murchison supplies no facts respecting infants, and few facts respecting children of 5—15, or old people of the age of 65 and upwards; but it is evident that the mortality is lowest at the age of 10—15, and rapidly increases as age advances; observing a very regular law of increase, from which the mortality at one age, between 15 and 55, being given, the mortality at any other age within that limit can be calculated.*

It appears to be established that patients are not liable to a second attack, either of typhus or of typhia, but that relapsing fever (typhinia) often recurs; and typhus follows typhia, as typhia follows typhus; both being as independent of each other as small-pox and measles. This being so, it is evident that as age advances the proportion of people susceptible declines, and we find that the calculated average liability of people living to attack decreases, until at the age, 45—55, the minimum liability is attained; and then only 20 in 10,000, or 2 in 1000; one annually in 500 experiences attack. At the age 35—45 the proportional number of attacks among 10,000 persons is 26·93, at 25—35 it is 43·30, at 15—25 it is 93·20. The facts do not justify us in proceeding further towards infancy, but they seem to imply that in childhood the liability to invasion, from greater susceptibility rather than from greater exposure to it, causes a maximum proportion of attacks.

We have then greater liability to attack in early manhood, conjoined with greater power of resisting the disease; so that the final result is an equal rate of mortality among the population at the ages extending from 25 to 45; for 6·67 died out of 10,000 living of the age 25—35; and 6·63 died out of the same number living in the next age, 35—45.

TABLE VI.—**Deaths** in **England** from **Scarlatina, Cynanche Maligna,** and **Diphtheria,** for each of the **Years 1855** to **1862.**

YEARS.	TOTAL.	SCARLATINA.	CYNANCHE MALIGNA, and DIPHTHERIA.	CYNANCHE MALIGNA.	DIPHTHERIA.
1855 - -	17,314	16,929	385	199	186
1856 - -	14,160	13,557	603	374	229
1857 - -	14,229	12,646	1,583	1,273	310
1858 - -	30,317	23,711	6,606	1,770	4,836

1860 - -	14,893	9,305	5,588	376	5,212
1861 - -	13,897	9,077	4,820	303	4,517
1862 - -	20,078	14,834	5,244	341	4,903
Total - -	154,382	119,369	35,013	5,233	29,780

---

* The calculated and observed rates of mortality in fever cases are shown below:—

Age.	Observed.	Calculated.
15—25	9·67	9·77
25—35	15·41	15·44
35—45	24·63	24·40
45—55	38·20	38·57

The mean annual increase of the death-rate is 4·7 per cent. for each year of age $\because m_{x+n} = m_x r^n = m_x (1{\cdot}047)^n$.

The higher rate of mortality, 9·02, at the ages 15—25, is probably connected in some way with the migration from the country to the towns, where the new comers are exposed to stronger forms of the zymotic exciter. "As far as the figures [of Louis, Chomel, and Murchison] go," says Dr. Murchison, "they show that recent residence in an infected locality increases the fatality of pythogenic fever."*

The expressive name, derived from πύθομαι putresco, and γεννάω, Dr. Murchison gives to typhia in his classical treatise; thus pointing to the constant fountain of impurity from which this bitter water springs to poison the kingdom. This is the form of fever which is so common in France; and which was characterized by Bretonneau of Tours in 1820 under the name of *dothinenterite*, and was analytically studied by Louis in Paris, and described by him in his great philosophical work, Sur la *Fièvre Typhoide* in 1829.† The putrid state of the air of the *cabinets* in all the hotels and houses of Paris at that time is an argument in favor of Dr. Murchison's doctrine,—that the fever is "often generated spontaneously by fæcal fermentation," and is occasionally communicated by the sick to the healthy directly through this medium, or through the air of cesspools and drains. The impurities and the seeds of the disease can only be eventually got rid of by a vigilant sanitary police; and by the effectual destruction of *typhine*, its exciting leaven.

* Murchison on Continued Fevers, p. 533.

† English and American students, and I among the number, had then an opportunity of studying this disease clinically under Louis at La Pitié, and thus carried away clear ideas of a disease which could no longer be confounded with typhus.

Typhus and famine fever (typhinia), like the pythogenic fever (typhia), are lit up by a specific zymotic matter, which is generated whenever human beings are badly fed, and are crowded together dirty in an in-

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

‡ The number of persons executed in the several years will not necessarily correspond with those in the same years of the "Criminal Returns," inasmuch as the executions recorded in each year in the latter are derived from the dates of conviction, while the numbers in this Table are classed under the years in which the deaths are registered.

§ The cases of angina membranacea which would now be put to diphtheria were formerly classed under the same head as scarlatina, but were distinguished in the notes.

adequate supply of fresh air. These two forms of fever fluctuate in intensity as the operation of their causes does, and give rise to the great spreading epidemics, which follow war and famine, and afflict the world.

Scarlatina, a disease of childhood, but also persecuting life through youth and manhood, had declined in 1861, and was then fatal to 9077 persons; in the next year the deaths by this disease were 14,834, which is nearly the

deaths afterwards declining to 5212 in the next year, and amounting to 4903 in 1862, when only 341 deaths were ascribed to cynanche maligna. Diphtheria is most fatal in childhood*; but it occurs more frequently in later years of age than scarlatina, which happens only once in life, and leaves adults armed for the future. The question of the possible recurrence of diphtheria, and its relations in this respect to scarlatina, demand further careful study. Together these diseases destroyed 19,298 lives annually in the last eight years. See Tables VI., VII., VIII.

The deaths from small pox were 6460 in 1858, and fell progressively to 1628 in 1862; measles remained nearly stationary during that period;

TABLE XI.—**Causes of Death in England in the Year 1862,** arranged in the order of Mortality.

CAUSES OF DEATH.	Number of Deaths registered in the Year 1862.	*Proportional Number* from each Cause to 1,000,000 Deaths from All Causes.

* For a good digest of our knowledge of diphtheria, see the second edition of Dr. Aitken's valuable work, "The Science and Practice of Medicine," pp. 565–573, vol. 1.

croup declined to some extent; whooping-cough stands now next in fatality among children's diseases to scarlatina, and its mortality is never in any year low. In the present year 12,272 persons died of whooping-cough. Of erysipelas 1523 persons died; of metria, supervening on childbirth, 940. Influenza has subsided; but it is undoubtedly often confounded with bronchitis or pneumonia, which are its frequent sequels or complications.

Of dysentery 1044 persons died; of cholera 511; while 11,112 died of diarrhœa, which is often the result of a zymotic poison allied to those of cholera and dysentery. Our deaths from ague and remittent fever are few, thanks to the progress of cultivation and drainage. These diseases still decimate the fairest lands of the world, and raged in London down to the seventeenth century, when they gradually subsided, and in the year 1862 the mortality in England, by ague and remittent fever together, was at the rate of only 21 deaths in 1,000,000 inhabitants. Rheumatism is allied to these affections, and remains after they have disappeared, proving fatal generally by fixing on the heart membranes, or the membranes of important organs.

Syphilis is the most fatal of the enthetic diseases; which, with stricture of the urethra, was the reported cause of 1444 deaths; while only one person died of hydrophobia and 4 of glanders. The deaths from hydrophobia were 11, 16, 14 in the years 1853–4–5; and 3, 4, 1 in the years 1860–1–2. The diminution of the deaths from this painful disease are justly referable to police regulations, and show to what an extent enthetic diseases and zymotic diseases generally may be brought under control by good sanitary regulations. Zymotic poisons, as dangerous as mad dogs, are still allowed to be kept in close rooms, in cesspools, and in sewers, from which they prowl, in the light of day and in the darkness of the night, with impunity, to destroy mankind.

Among the *dietic diseases* we have starvation, of which 73 people died; the privation of the mother's breast-milk, fatal to 1006 infants; scurvy and purpura causing 353 deaths; delirium tremens 471; intemperance in other forms 246.

Parasitic diseases diminish with the progress of cleanliness; worms enter the body through water generally, and sometimes through diseased meat: 156, chiefly children, died of worms. Should arrangements be made to dispose of the sewerage of towns, and to supply houses with pure water, we may hope to see the deaths by worms diminish.

The total deaths from zymotic diseases were 91,539; and the mortality from them was at the rate of 4·551 per 1000.

II. Constitutional Diseases.

Gout killed 284 persons; and mortification 1288, noma 197; but the deaths are principally from dropsy, 7247, and cancer,—under which soft and hard, and epithelial cancer are included. Taking the increase of population into account, the proportion of deaths by cancer in the returns has steadily increased from 280 to 368 per million of the population; while dropsy has fallen from 562 to 360; and mortification from 80 to 64. This is partly due to improvements in diagnosis; for if it is true that all our knowledge of things consists of the ideas to which they give rise in mens' minds, this is especially the case of the causes of death; which, in the returns, represent the judgment of the medical practitioners of the day, wielding the medical art of the day, and every year improving with the advance of all the sciences. The deaths from dropsy, which in former years would have been returned under that head, are now traced to organic changes of the heart and kidneys. Some will be found under nephria; some under heart disease. A common sequence is, rheumatic fever; heart membranes injured; circulation obstructed; dropsy.

The total deaths by the diathetic diseases was 16,412.

The tubercular order includes scrofula, tabes mesenterica. hydrocephalus, and consumption (phthisis), and 66,612 deaths in the aggregate, of which 50,962 were due to phthisis. The mortality by phthisis was 2·533 in 1000; and in every 1000 deaths 118 were by this fatal malady. There is some evidence of reduction in the mortality, which in 1850–4 and 1858–62 was at the rate of 2·811 and 2·586 per 1000; thus showing a diminution of ·225 in the annual death-rate. Unhappily, the deaths by bronchitis, with which in the chronic state phthisis is liable to be confounded, increased more than the deaths by phthisis fell. Tubercular deposits, which in adults take place in the lungs, affect the brain and mesenteric glands of children, and give rise to water in the head and abdominal disease. Hydrocephalus, like phthisis, has somewhat fallen off.

III. Local Diseases.

170,651 deaths fall under this class, which comprises four-tenths of the total deaths in the country, arising chiefly from affections of the vital organs, of the head, chest, and abdomen.

25,286 of the 55,692 deaths by diseases of the nervous system (brain, spinal marrow, nerves) are from the convulsions of infancy, in which, as all the functions are then imperfectly developed, the symptoms of disease are also obscure. The convulsions of a child impress the observer; but they may frequently be traced by careful analysis to a variety of antecedent causes, of whose operations they are the manifestations. Cephalitis includes under it all the inflammations of the brain and its membranes; of which 3580 persons died. About apoplexy and paralysis there is less perplexity; but the paralysis is often the sequel of the apoplexy, and the two maladies taken together account for 18,869 deaths; insanity for 535, chorea for 52, and epilepsy for 2443. 6 deaths were ascribed to fright, 7 to grief, one to rage, and 44 to melancholy; which are returned, with other mental affections, under insanity. 36 deaths are returned from idiopathic tetanus, 30 from ophthalmia, and 58 from otitis. 18,709 deaths were referred to diseases of the heart and large blood vessels, including 373 by aneurism, 218 by angina pectoris, and 193 by syncope.

The importance of the breathing organs is revealed by the 67,565 deaths which are the result of their diseases. The larynx was the seat of 1478 fatal diseases; it is often affected in phthisis, and is closed, and thus causes suffocation in croup, diphtheria, and scarlatina. Of bronchitis 32,526 persons died; of pneumonia 23,713; of pleurisy 833.

It is remarkable that the mortality from bronchitis was at the rate of 8·22 and 16·17 per 10,000 living in the years 1850 and 1862; while the mortality from pneumonia in the two years was 11·43 and 11·79. Thus

---

Table XII.—**Average Annual Rate** of **Mortality** to **10,000 living** by **Phthisis** and **Lung Diseases** in **England**, for the Three Periods **1850–54, 1855–57,** and **1858–62.**

Years.	Lung Diseases.	Phthisis.	Phthisis and Lung Diseases.	
			Total.	Increase in the Periods.
(5 Years.) 1850–54	27·69	28·11	55·80	—
(3 Years.) 1855–57	31·03	26·83	57·86	2·06
(5 Years.) 1858–62	33·09	25·86	58·95	1·09

the mortality by the latter affection remained stationary; by the former doubled. This is the result of taking terms of years:

———	Mean Annual Mortality to 10,000 living.		
	Pneumonia.	Bronchitis.	Bronchitis and Pneumonia.
1850-54 (5 Years) - -	12·39	10·16	22·55
1858-62 (5 Years) - -	12·50	15·33	27·83
Excess in the later Years	·11	5·17	5·28

It was shown by Professor W. T. Gairdner that cases of lobular pneumonia, as it was once called, are condensations of the air cells from bronchitis, when mucous plugs, like valves, allow the air egress, but forbid its ingress. The transfer of cases from pneumonia cannot account for the change, inasmuch as the mortality from both affections increased.

The bronchitis from dust, called grinder's asthma, rot, and other names, as well as the miner's disease, is easily confounded with tubercular phthisis; and it is possible that there may have been some change of nomenclature.

Upon classing together all the respiratory diseases, except phthisis, assuming the living to be 10,000, we find that the annual mortality increased through three periods from 27·69 to 33·09 in 10,000, or 5·40 in the aggregate, nearly the whole of which (5·17) is ascribable to the

increase of deaths from bronchitis. By uniting phthisis to the lung diseases we get rid of any ambiguities of nomenclature; and the mortality from the two groups of chest disease is still found increasing from 55·80 to 58·95, or 3·15 in 10,000. The diminution of the phthisis-rate is 2·25, and this brings down the increase from 5·40 to 3·15.

Of these diseases 5·895 in 1000 of the people died annually during the last five years, when the mortality from all causes was 21·467 in 1000. The question is therefore one of great magnitude, and it requires ample discussion,—What has led to the recent increase of mortality from inflammation of the air passages and air cells of the lungs?

This subject is full of interest; and Table XIII. shows clearly that the mortality from bronchitis increased chiefly in childhood and at advanced ages, the increase being perceptible at the ages after 35 years. The increase is not due to confusion of nomenclature; and when the deaths from phthisis and bronchitis are thrown into one table, the results are of the same character. The low temperatures of the winters of 1853, of 1855, and of 1860 are elements of which the influence will be demonstrated in a subsequent report.

The mortality by diseases of the digestive organs was at the rate of 9·66 in 10,000 living; 19,421 persons died of these diseases. Since 1850 enteritis, ileus, and ulceration of the bowels have been less fatal than they were; peritonitis, ascites, and intussusception, stricture of intestinal tube and hernia, have varied little; and there is little change in the liver diseases, taken collectively, and including jaundice.

The diseases of the urinary organs led to 5328 deaths; so the mortality from diseases of this part of the system is 2·65 in 10,000. The aggregate mortality from these diseases is less than the *increase* in the fatality since 1850 of bronchitis. Some of these diseases, nephritis and nephria (Bright's disease), increased largely; perhaps only in appearance, arising from a change due to the diffusion of pathological knowledge. Fatal stone cases decreased; and this may fairly be attributed to the discovery of the operation by which the necessity of cutting is obviated in many cases. Upon the other hand, cystitis and nephritis, the inflammation or irritation of the mucous membranes, have grown more fatal. These are the evils to be obviated in using crushing instruments.

The diseases of the organs of generation killed 1227 persons; those of the organs of locomotion 1588; and those of the skin and integuments 1121. These diseases, which are so common and troublesome, or even painful, are not often fatal.

I may refer to one disease, ovarian dropsy, which in its ordinary decisive form is almost always fatal. The deaths from this disease, affecting the ovaries of women, were 280. Recently a bold operation has been practised by Mr. Spencer Wells and others, who cut through the covering of the abdomen, and take out the ovaries containing the cysts.

Mr. Spencer Wells informs me that he has operated in 100 cases; 66 women recovered, 34 died; and in his opinion 185 of the women who died in the year might have been saved by surgery. The diagnosis is sometimes fallacious.

The mortality is greater by this disease than it was formerly; thus, 12 of 1,000,000 died in 1850, and 14 out of the same number in 1862.

IV. Developmental Diseases.

This class includes the maladies specially incidental to the procreation, development, nutrition, and decay of man. Under it 68,842 deaths are

placed, including those from premature birth, malformations, and teething, old age, and atrophy or debility; besides 2137 from childbirth. Including the deaths from metria, the deaths of child-bearing mothers were 3077.

Upon comparing the deaths in childbirth with the registered children born alive, a large decrease in these most distressing deaths is observable; for beginning with 60 deaths to 10,000 children born alive the series ends with 43. About a thousand mothers survived in 1862 who would have perished had the mortality remained the same as it was in 1847. The improved registration of births accounts for only a portion of the apparent rate of decrease.

V. Violent Deaths.

14,944 violent deaths were recorded in the year, and the mortality by them was at the rate of 7·43 deaths by violence in every 10,000 inhabitants; that is 6·49 by accident or negligence, 0·65 by suicide, 0·21 by homicide, 0·01 by execution; leaving 0·07 unspecified. Thus about one death in 29 is by violence.

Of the 13,055 deaths by accident or by negligence, 5397 were the result of fractures or contusions; penalties inflicted generally by the law of gravitation, and often incurred very carelessly.

I have formerly called attention to the great number of people burnt and scalded to death in England and Wales. The number of such deaths was 3166, 3053, and 2767 in the three last years; so, allowing for increase of population, the mortality was 161, 154, and 138 annual deaths by burns and scalds to every million inhabitants. The deaths by burns and scalds fluctuate; the proportion in previous years was highest (171) in 1855, lowest (142) in 1857; and never before so low as it was last year (138). By due precautions and constant assiduous care the number of these fearful deaths might be still further reduced.

The accidental deaths by poison per million living varied from 21 to 26 in the years 1850–7; and fell to 15, 14, 12, 13, and 13 in the five years 1858–62. This is fairly referable to the increased care of the chemists and druggists, and to judicious legislation. No precautions against these deaths are too great; they diminish the fatality of accidents, and make suicide and murder difficult, by poisons. The ratio of deaths by drowning has also fallen. This is exclusive of the deaths by drowning at sea.

The violent and sudden deaths are generally inquired into by the coroners, who held 20,791 inquests in the year.* The juries in 2429 instances returned verdicts of "found dead," in 7118 instances "natural death," as the result of their investigations. Dr. Lankester, one of the coroners for Middlesex, in a first report, has given a statistical account of the inquests of the year, and has appended to his tables practical commentaries which tend to enhance the utility of his office.† The coroners' court has recently been put on a better footing than it was formerly, but it admits of still further improvement. The machinery for supplying the coroners with information is imperfect, as Dr. Lankester points out, and the causes of death are left undiscovered in many instances, because the court cannot command all the resources of medical science.

† The Social Science Review, edited by B. W. Richardson, M.A., M.D., No. VI., p. 506.

I refrain from discussing the influence of age and of locality on health, as I hope to have an opportunity of investigating these topics in the supplementary volume, which will give the results of the registration of the ten years lying between the two last censuses.

I have the honour to be,
Sir,
Your obedient servant,
W. FARR.

To
The Registrar-General.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]

For names of Towns, such as Chester, Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 197) *and "Index of certain Towns"* (page 207).

A

Aberayron, 596.
Abergavenny, 578 *a*.
Aberystwith, 597.

INDEX OF SUB-DISTRICTS.

[In this alphabetical arrangement the principle is adopted of placing the Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G as "Grinstead, East;" St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to the order in which it appears in the arrangement of the Districts in the Tables of Abstracts; thus, Abbey Holme (569; 2) is the 2d Sub-District of the Wigton District, No. 569.]

Sub-District.	District.	No.
A		
Abbey	Bath	326; 3
Abbey Holme	Wigton	569; 2
